INSTRUKTIONSBOG FOR
SAILOR S1303/S1304 - I

INSTRUCTION BOOK FOR
SAILOR S1303/S1304 - I

A/S S. P. RADIO · ALBORG · DENMARK

FOR YOUR INFORMATION

This preliminary instruction book for S1303/04-I is based on the instruction book for S1303/04, which you have to observe when using the service section in this preliminary book.

The VCO and HARMONIC FILTER modules have the module numbers 1200/1300 because the modules from the receiver R1119/20/21 have been used in S1303/04-I.

VCO module 1200/R11XX = module 300 S1303/04-I.

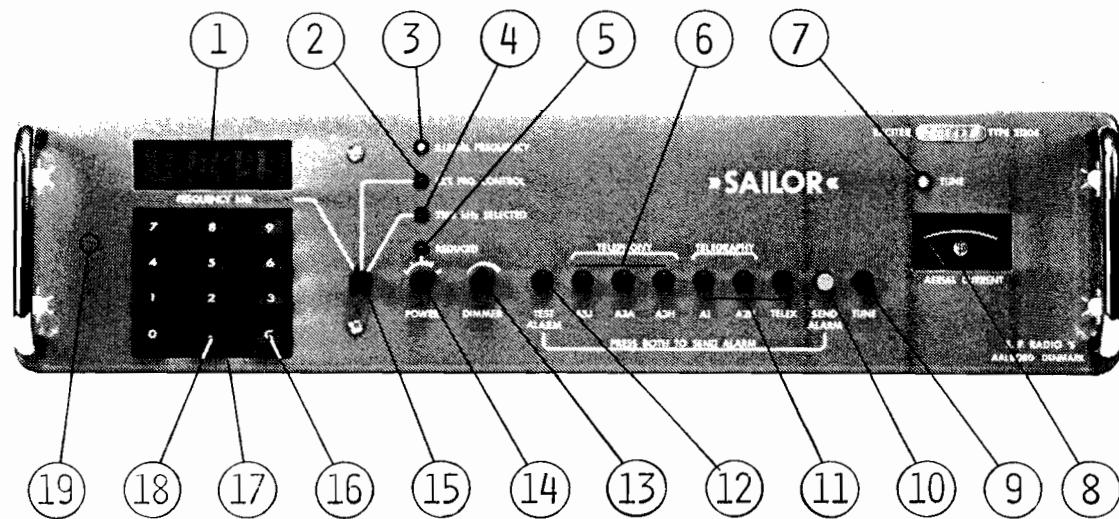

HARMONIC FILTER module 1300/R11XX = module 400 S1303/04-I.

If you want to receive the final instruction book when it is ready, please fill in the form in front of this book and return it to us. You will then receive the final instruction book when it is ready.

MAIN SCHEMATIC DIAGRAM	

CONTROLS

(1) DISPLAY

Displays the keyed-in figures or the transmitted frequency.

(2) EXT. FRQ. CONTROL

With the switch (15) in position EXT. FRQ. CONTROL the lamp lights. The displayed and transmitted frequency can be controlled from an external unit the SAILOR ARQ H1240.

(3) ILLEGAL FREQUENCY

When the displayed frequency is a non operative frequency, the lamp lights.

(4) 2182 kHz SELECTED

With the switch (15) in position 2182 kHz SELECTED the lamp lights. The displayed and transmitted frequency is 2182 kHz.

(5) REDUCED

Is alight when the output power is reduced by the power switch (14).

(6) A3J (J3E), A3H (H3E) and A3A (R3E).

Selects transmission mode A3H (H3E), A3A (R3E) or A3J (J3E).

(7) TUNE *

During tune procedure a fixed light is seen. When the lamp turns off the transmitter is ready for use. Is the lamp flashing at a slow regular rate the transmitter can be ready for use but with a SWR above 2, or the transmitter can be blocked.

(8) AERIAL CURRENT

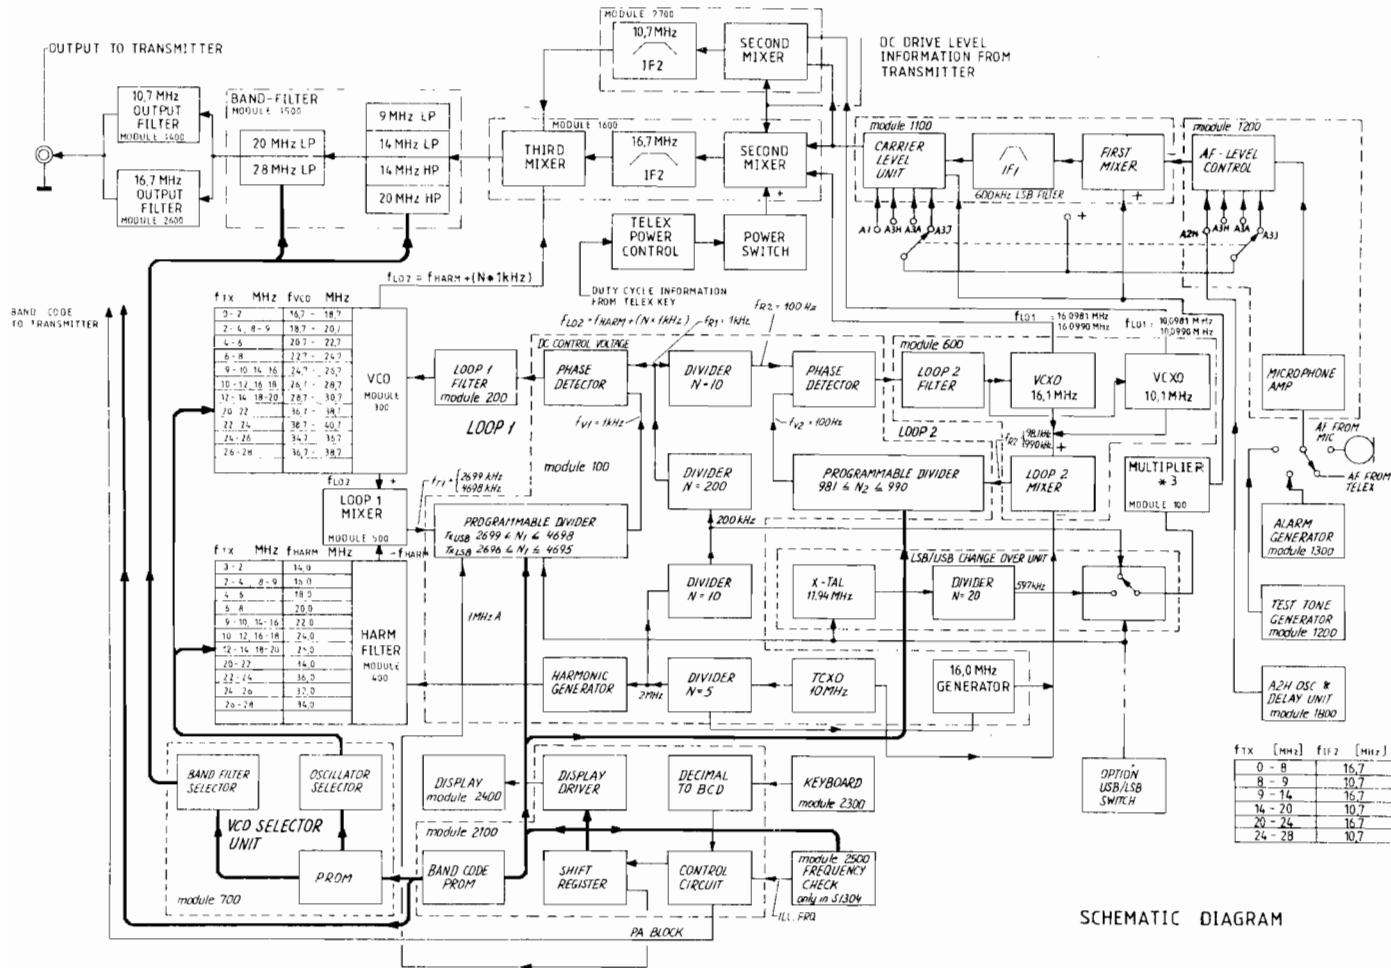

Shows the current at the aerial insulator of AT1500.

CONTROLS cont.:

- (9) TUNE
Starts the automatic tune system of T1130 and AT1500.
- (10) SEND ALARM/TEST ALARM
When SEND ALARM and TEST ALARM are activated simultaneously. The transmitter is keyed and transmits the two-tone-alarm signal.
- (11) TELEX, A2H (H2A) and A1 (A1A)
Selects the transmission mode TELEX (F1B, F1C) or the TELEGRAPHY modes, A2H (H2A) or A1 (A1A). The modulating frequency in A2H (H2A) mode is 465 Hz.
- (12) TEST ALARM
Starts the two-tone-alarm signal generator. The signal can be heard in the microtelephone.
- (13) DIMMER
Controls the light intensity of the DISPLAY, the aerial current METER and the lamps EXTERNAL FRQ. CONTROL, 2182 kHz SELECTED, POWER REDUCED.
- (14) POWER
Reduces the RF output power in four 5 dB steps.
- (15) DISPLAY INPUT SWITCH
With the switch in position KEYBOARD the displayed and transmitted frequency is keyed-in from the keyboard. With the switch in position EXT. FRQ. CONTROL the displayed and transmitted frequency is controlled from an external unit (SAILOR ARQ H1240).
With the switch in position 2182 kHz SELECTED the displayed and transmitted frequency is 2182 kHz.
- (16) CLEAR
When pushed the display is cleared and a new frequency can be keyed-in.
- (17) KEYBOARD
Enters the frequency into the frequency synthesizer and the display. The frequency shall be entered in kHz, and only if a fractional kHz is wanted it is necessary to activate the decimal point key. Before a new frequency is entered, and if a wrong figure is keyed-in, all the display is cleared by means of the clear key C and the new frequency can be keyed-in.
- (18) DECIMAL POINT KEY
If a fractional kHz is wanted it is necessary to activate the decimal point key.
- (19) USB/LSB
If fitted, the transmitted sideband, the upper or the lower, can be chosen by the switch.

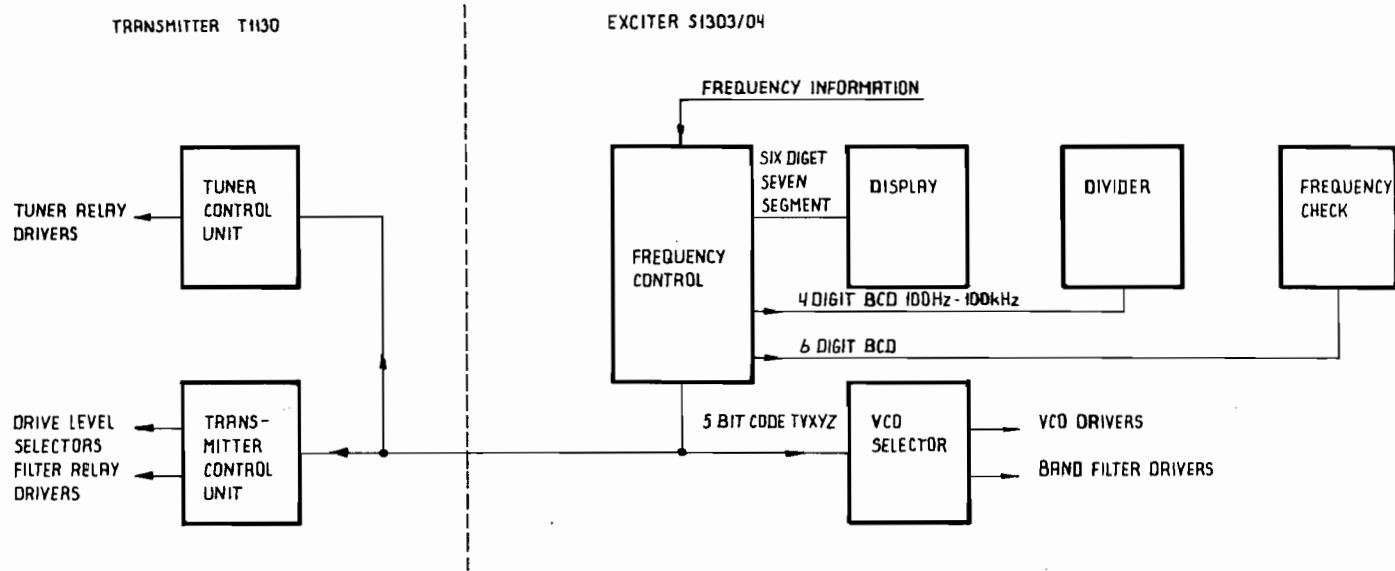

* For further instruction see OPERATING INSTRUCTIONS FOR SAILOR PROGRAMME 1000/B

PRINCIPLE OF OPERATION

The frequency control unit receives the frequency input from the keyboard (or external equipment) and transfers this input to usable codes for control units in exciter and PA-unit. The frequency information from the keyboard is converted to a six digit BCD-code which is used in the divider unit and by the frequency check unit (S1304). A five bit code (T, V, X, Y, Z) is generated from the three most significant of the six digit BCD-code. With this five bit code the frequency area (1,6 - 28 MHz) is split up in a certain amount of bands. The area 1,6 - 8,5 MHz is covered by 21 codes and the frequency bands 12, 16, 22, 25 and 2182 MHz fixed are allocated one code each. Two codes are used for blocking of the PA-stage (00000, 11111). Since five bits give 32 possible codes, there are four left for special use. The five bit code controls the VCO and bandfilter selection in the exciter. Besides it is used in the PA-stage to control the pre-setting of the aerial coupler. In addition it is used in connection with selection of drive level potentiometer and harmonic filter in the PA-stage.

S1303/4 A1/9
4-0-25101

FREQUENCY STORE

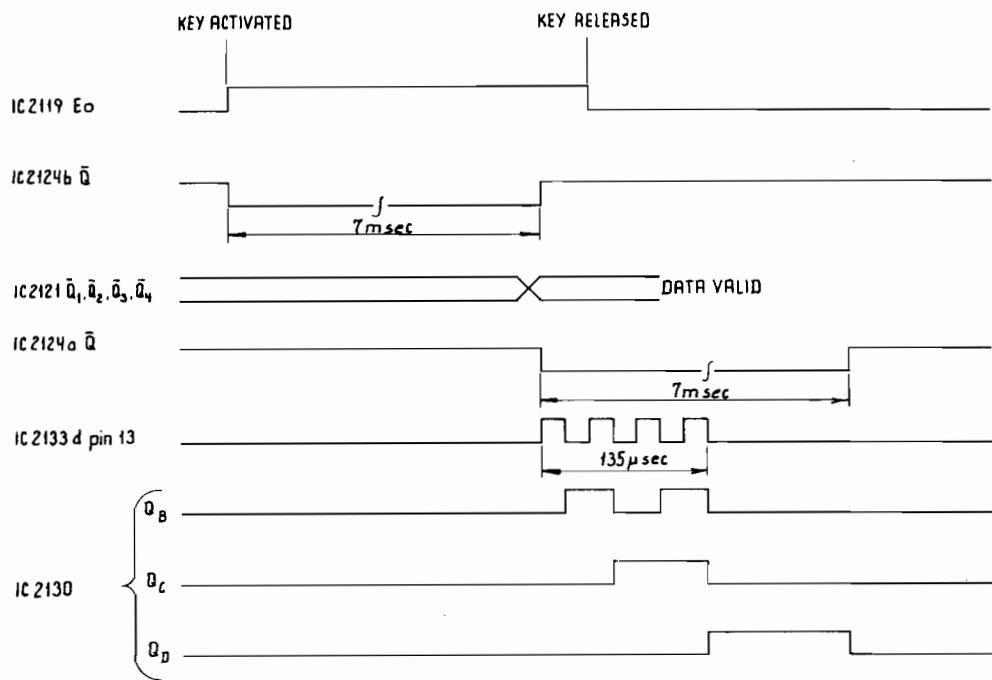

The frequency input is stored in six eight bit shift registers IC2107-IC2112, which can be loaded both in parallel and in serial mode, depending on the logic level of the S/L input "0" for parallel mode. The frequency information runs in series into the registers and when the input is finished, the registers are shifted to parallel mode, and now they will be loaded with their own information if any clockpulses come (can occur by activating the keyboard keys).

Read-in begins in the 100 Hz digit and if a new number is keyed in, the former shifts a step to the left in the display and so on. When the point key is activated, a zero is read in on the 100 Hz place, and after this the digits to the left of the point must not be changed by a new key press. This is obtained by putting IC2108-IC2112 in parallel mode by means of IC2129a. A subsequent key press will cause a read-in of the digit into IC2107, besides IC2129b will change state and thereby set IC2107 in parallel mode, which will prevent further input into IC2107 until CLEAR has been activated. A press on the TUNE button will cause the same change of mode for IC2107-IC2112. 22V for TUNE will, via gate 28 and gate 27, cause a zero read into IC2107. Furthermore IC2129b and IC2129a will change state in the mentioned order and thereby set IC2107-IC2112 in parallel mode. When IC2129a is cleared by IC2129b, it will clear IC2126a, which will turn on the point in the display

FREQUENCY INPUT VIA KEYBOARD

The key CLEAR zeroes the register IC2107-IC2112 and sets IC2129a and clears IC2129b so that serial input to IC2107-IC2112 is permitted. A subsequent key press sets up, via IC2119 and IC2120, the BCD-code for the digit in question on the data inputs of IC2121. Simultaneously the monostable FF IC2124b is triggered and after 7 msec (it is assumed that keybounce is over now) it returns and clocks the digit information into IC2121, which is a four bit register. Furthermore the monostable FF IC2124a is triggered by IC2124b and thereby allows the oscillator IC2133d to start. Now the digit information in IC2121 is fetched via IC2122 and clocked into the register IC2107 on the positive edge of the clockpulses. IC2122 is an eight input multiplexer. The output Y_0 is connected to one of the inputs D_1-D_8 of which one is selected with the code on inputs A, B, C. IC2122 is controlled by the counter IC2130 which counts up on the negative edge of the clockpulses to the shift register IC2107. When the counter reaches four it stops the oscillator via IC2127 and IC2131. Later the monostable FI IC2124a returns and clears the counter IC2130. Now the circuit is ready for another key press. The timing of the keyboard input is shown in fig.

FIG.2

TIMING OF FREQUENCY INPUT VIA KEYBOARD

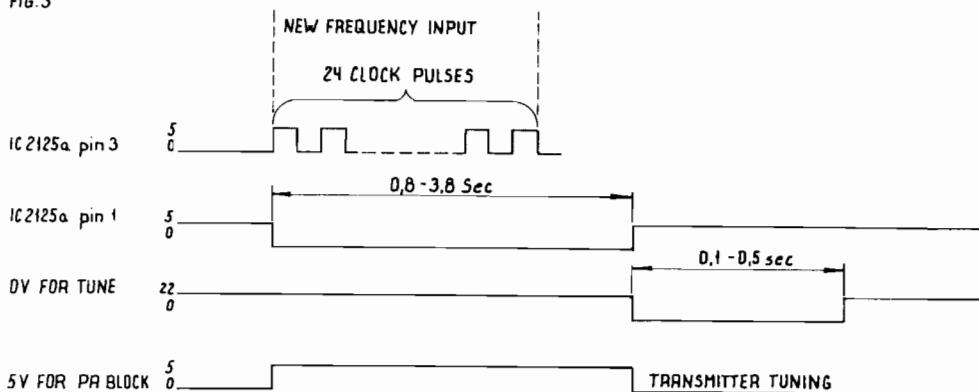

A3/9

S1303/4
4-0-25099FREQUENCY INPUT FROM EXTERNAL EQUIPMENT

The external input mode is obtained when the input EXT. FRQ. CONTROL is grounded. Then IC2129b is cleared and IC2129a is pre-set and hereby the registers IC2107-IC2112 are ready for serial input. The serial data must consist of 24 data bits with corresponding clockpulses. The clock and datapulses are shaped in the Schmidt triggers IC2133b and IC2133a. To avoid disturbance from the keyboard, IC2122 is cleared on pin 7 and IC2124b on pin 11.

At external frequency input the PA-stage is blocked when the first clock-pulse arrives, and when the read-in is over, a tune information is sent to the PA-stage, if the HTON input is held on 22V. If HTON is low at the end of a read-in the transmitter will not tune automatically, but now it will tune when HTON is turned on 22V. The circuit which handles the above-mentioned events consists of IC2125a, IC2125b and surrounding components. The actual timing of transmitter blocking and tuning is shown in fig. 3.

FIG.3

THE SHOWN DIAGRAM IS ONLY VALID IF HT DN = 22V AND EXTERNAL FREQUENCY INPUT IS SELECTED WHICH CAUSE IC2125a's pin 5 ON OV.

GENERATION OF THE FIVE BIT CODE (T, V, X, Y, Z)

The five bit code is programmed in the PROMs IC2114 and IC2115. The frequency information from 10 MHz, 1 MHz and 100 kHz digits is used to address one of the two PROMs. In this way it is possible to change band code in 100 kHz steps. The 10 MHz and 1 MHz BCD-codes are in a BCD to binary converter IC2216 and IC2118 transformed to a binary code which addresses the PROMs, besides this circuit selects the PROM which has to be active. The BCD to binary conversion takes place in an adder IC2116. A fixed figure (depending on 10 MHz input) on the B-input of the adder is added to the 1 MHz input on the A-input. This results in a binary representation of the BCD-digits at 10 and 1 MHz. The used figures on input B are shown in table 1. To 2182 kHz fixed corresponds a special band code which is obtained by turning high the address inputs A₂ and A₃ on IC2114 and IC2115.

Additionally the PROMs contain a blocking possibility for the PA-stage with 100 kHz steps. To block the transmitter it is necessary to programme a "1" in the output 1 on the desired 100 kHz steps. The blocking takes place via T2105 and T2101.

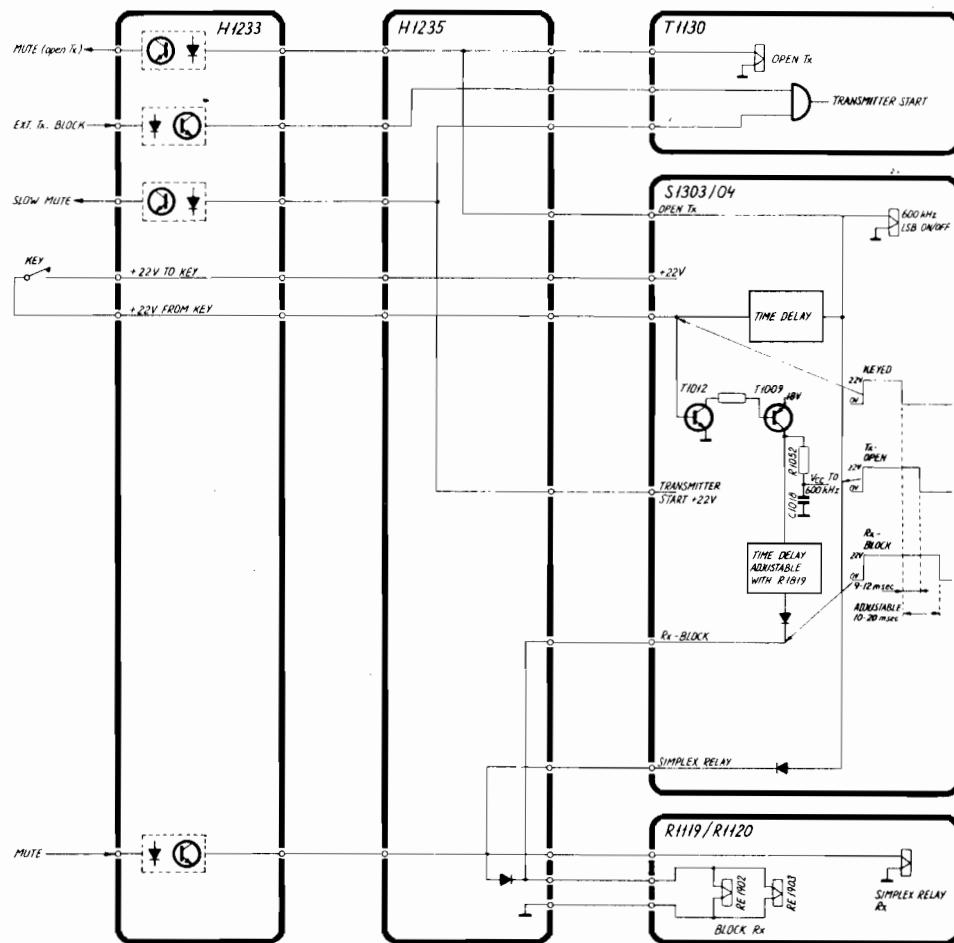

TABLE 1

FREQUENCY	B ₄ B ₃ B ₂ B ₁	B-Input on ADDER IC2116
0 ≤ f < 10 MHz	0 0 0 0	IC2115 selected
10 ≤ f < 20 MHz	1 0 1 0	
20 ≤ f < 30 MHz	0 1 0 0	IC2114 selected

DISPLAY DRIVER

The display is a LCD display which demands an alternating voltage across every segment. A segment is turned on if the alternating voltage on the backplane is out of phase with the alternating voltage on the segment in question, and the segment is off if the voltages are in phase. The oscillator IC2133c runs at 100 Hz which is divided by two in IC2126b. The 50 Hz signal is led to the backplane driver 3/4 IC2132 via a level shifter T2112. Additionally the 50 Hz signal is used in the segment drivers IC2101-IC2106 which converts the BCD-input to a seven segment code, and with an alternating output voltage for the LCD segments. The point in the display is driven from 1/4 IC2132 and the state of it (ON/OFF) is established by IC2126a. Depending of the logic state on pin 13 of IC2123 the exclusive - or gate acts as an inverter or a non-inverter and hereby turns the point on or off.

PRINCIPAL DESCRIPTION OF TELEGRAPHY MODE

TELEGRAPHY:

See principal diagram above.

PULSE SHAPING:

When the key is pressed and released the transmission starts and stops. The switch off time of the transmitter is delayed 9-12 msecs in order to produce the correct output signal shape (R1052, C1018).

FULL BREAK-IN:

The receiver is blocked for a time period of about 10-20 msecs after the key is released. This secures full break-in on the receiver.

MUTE:

The receiver can be blocked when a DC voltage is applied to MUTE.

EXT. TX BLOCK:

The transmitter can be blocked when a DC voltage is applied to EXT. TX BLOCK.

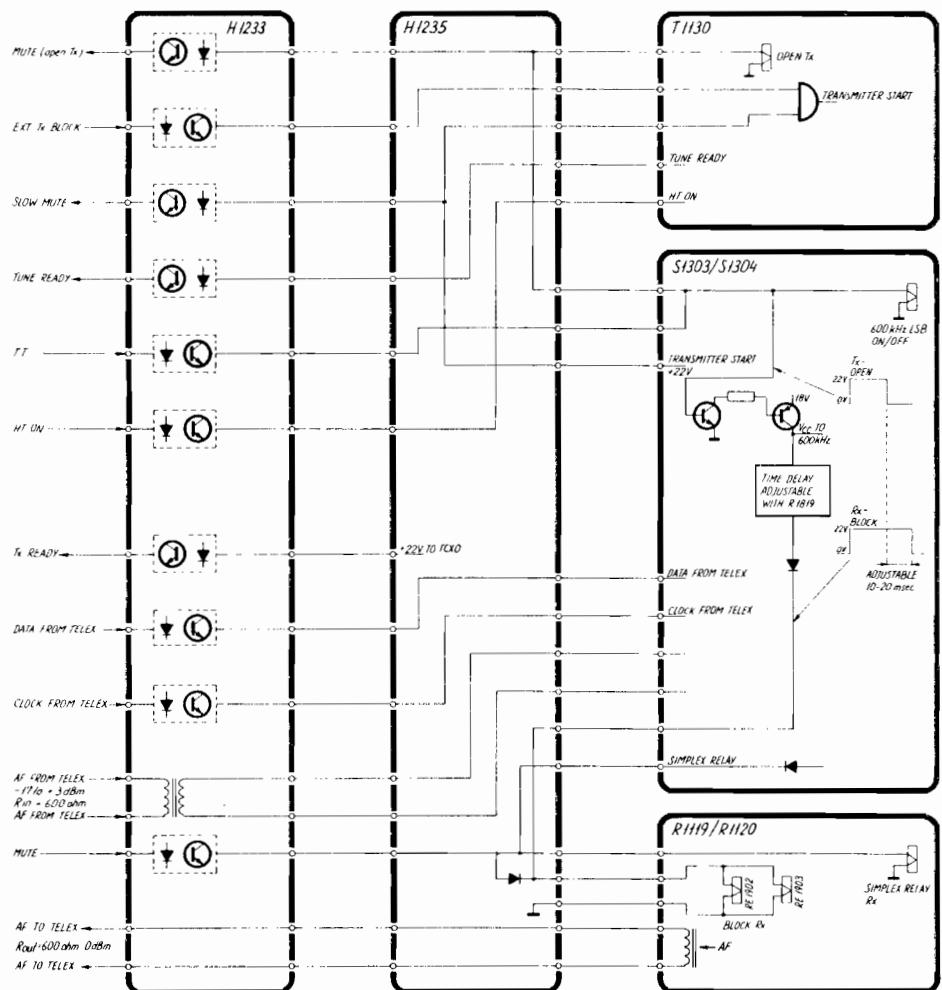

MUTE (open TX):

MUTE (open TX) can be used to block another transmitter when key down.

SLOW MUTE:

SLOW MUTE: can be used to block another transmitter.

PRINCIPAL DESCRIPTION OF TELEX MODE

TELEX:

See the principal diagram above.

TX READY:

Indicates that the transmitter is switched on.

HT ON:

Switch on the 22V DC supply to the exciter and the 8V DC supply to the power unit (T1130).

TT

This information is used to switch the short wave set between transmit and receive mode by setting open TX on/off.

When TT from telex is in transmit mode the transmitter is open and the receiver is blocked. When TT from telex changes to the receive mode the transmission stops immediately and the receiver is blocked for another 10-20 msecs controlled from the TIME DELAY (adjustable with R1819). This delay must last until the transmitter output is less than the sensitivity of the receiver. The delay is pre-adjusted from the factory to 12 msecs which secures a good reception with only 20 dB attenuation between the receiver and the transmitter aerials.

PRINCIPAL DESCRIPTION OF TELEX MODE cont.:

TUNE READY:

Indicates that the transmitter is ready to transmit, a steady yellow light is seen on the exciter front plate.

MUTE (open TX):

Is connected to TT and can be used to block another transmitter.

EXT. TX BLOCK:

The transmitter can be blocked when EXT. TX BLOCK is activated.

SLOW MUTE

Is connected to transmitter start and can be used to block another transmitter. When the exciter is in TELEX MODE transmitter start is activated.

MUTE:

The receiver can be blocked when MUTE is activated.

AF TO TELEX:

A constant level AF output from the receiver to the telex equipment.

AF FROM TELEX

The AF input signal from the telex equipment to the exciter is connected here.

DATA FROM TELEX/CLOCK FROM TELEX

This are input terminals to the exciter external frequency control. The transmitting frequency can be controlled by data on this input terminals.

PROGRAMMING OF S1304 FREQUENCIES

To open a new transmitting frequency in the exciter S1304 it is necessary to program the PROM's IC2512, IC2510 and IC2508 placed on the frequency check band. The PROM's are preprogrammed with a set of frequencies, but not all the prom addresses are used. The not used addresses can be programmed when it is wanted to open a new transmitting frequency.

PROM IC2512 is programmed with the 10 MHz and 1 MHz frequency information in BCD code.

PROM IC2510 is programmed with the 100 kHz and 10 kHz frequency information in BCD code.

PROM IC2508 is programmed with the 1 kHz and 100 Hz frequency information in BCD code.

To program a new frequency into the PROM's the PROM PROGRAMMER SAILOR H233 together with the address input unit SAILOR H237 can be used.

PROGRAMMING EXAMPLE S1304:

1. Select the appropriate PROM-manufactor on the PROM PROGRAMMER H233.
2. Activate the RESET button on the PROM PROGRAMMER H233 once.
3. Press the INSERT push button on the PROM PROGRAMMER H233.
4. The PROM to be programmed is placed in the appropriate socket.
Start the programming procedure with IC2508.
5. Release the INSERT push button.
6. Change the address input from the ADDRESS UNIT H237 until a not used address is found. All the red diodes will be alight.
7. Select the output code to be programmed by means of the eight slide switches. The output code is indicated by the yellow diodes with a lighting diode representing a logic "high" level.

IC2508: address set up 9A
wanted frequency 7.5 kHz

01 02 03 04 05 06 07 08
BCD: 1 0 1 0 1 1 1 0

8. Activate the BURN push button on H233.
9. The red and yellow diodes shall now show the same code.
10. Change IC2508 by IC2510.
11. Set up the wanted frequency code and push the BURN button.
12. Change IC2510 by IC2512.
13. Set up the wanted frequency code and push the BURN button.
14. Replace the PROM's in the exciter and control, by setting up the programmed frequency on the display, that the yellow diode ILLEGAL FREQUENCY on the front plate is not alight.

If more frequencies are to be programmed, start at point 1. of this procedure for every new frequency.

PROGRAMMING OF S1304 FREQUENCIES cont.:

CONVERTION TABLE (decimal to BCD).

Decimal	BCD			
	0 ₁	0 ₂	0 ₃	0 ₄
0	0	0	0	0
1	1	0	0	0
2	0	1	0	0
3	1	1	0	0
4	0	0	1	0
5	1	0	1	0
6	0	1	1	0
7	1	1	1	0
8	0	0	0	1
9	1	0	0	1

SERVICE

1. MAINTENANCE
2. NECESSARY TEST EQUIPMENT
3. TROUBLE-SHOOTING
4. PERFORMANCE CHECK
5. ADJUSTMENT PROCEDURE
6. NECESSARY ADJUSTMENTS AFTER REPAIR
7. FUNCTION CHECK

1. MAINTENANCE

1.1.

When the SAILOR SHORT WAVE PROGRAMME 1000/B has been correctly installed, the maintenance can, depending on the environment and working hours, be reduced to a performance check at the service workshop at intervals not exceeding 5 years. A complete performance check list is enclosed in the PERFORMANCE CHECK section.

Also inspect the antennas, cables and plugs for mechanical defects, salt deposits, corrosion and any foreign bodies.

Along with each set a TEST SHEET is delivered, in which some of the measurings made at the factory are listed. If the performance check does not show the same values as those on the TEST SHEET, the set must be adjusted as described under ADJUSTMENT PROCEDURE.

Any repair of the set should be followed by a FUNCTION CHECK of the unit in question.

2. NECESSARY TEST EQUIPMENT

DIODE PROBE

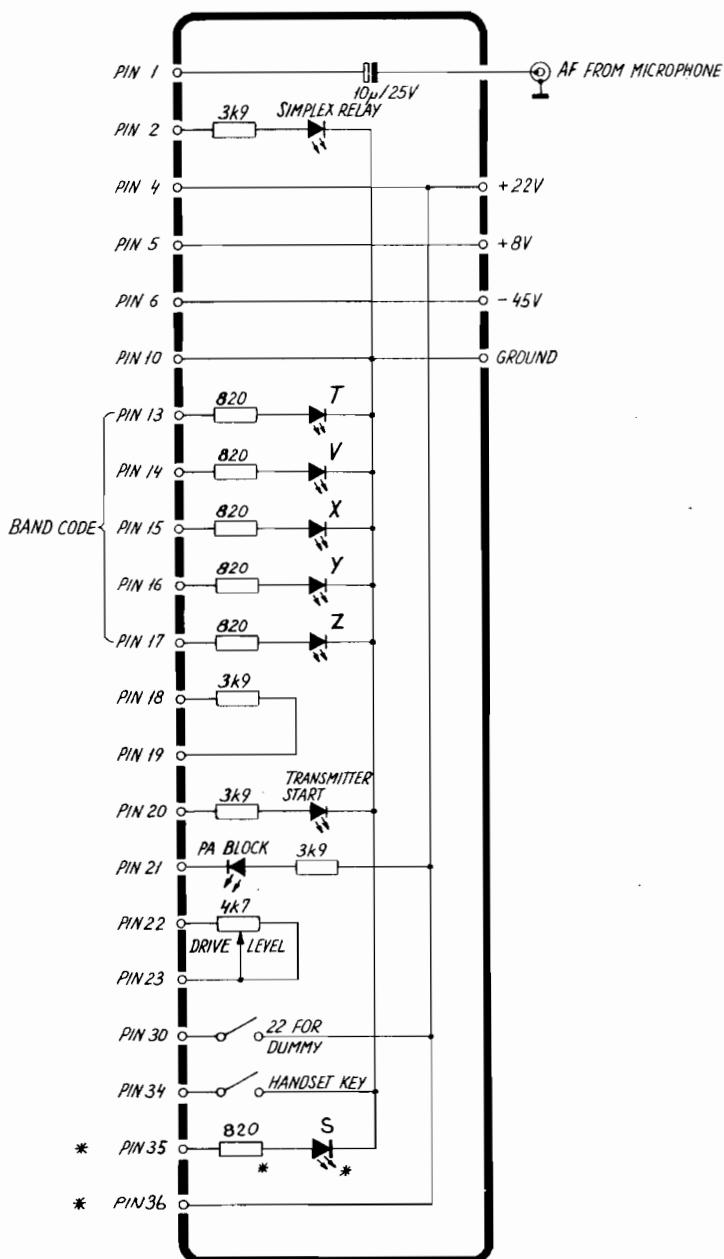

LAYOUT OF THE PROBE

NECESSARY TEST EQUIPMENT cont.:

SCHEMATIC DIAGRAM FOR TESTBOX S1302/03/04

* Not fitted in testbox for S1303/04

TVXYZ: The diodes are alight according to the chosen bandcode.

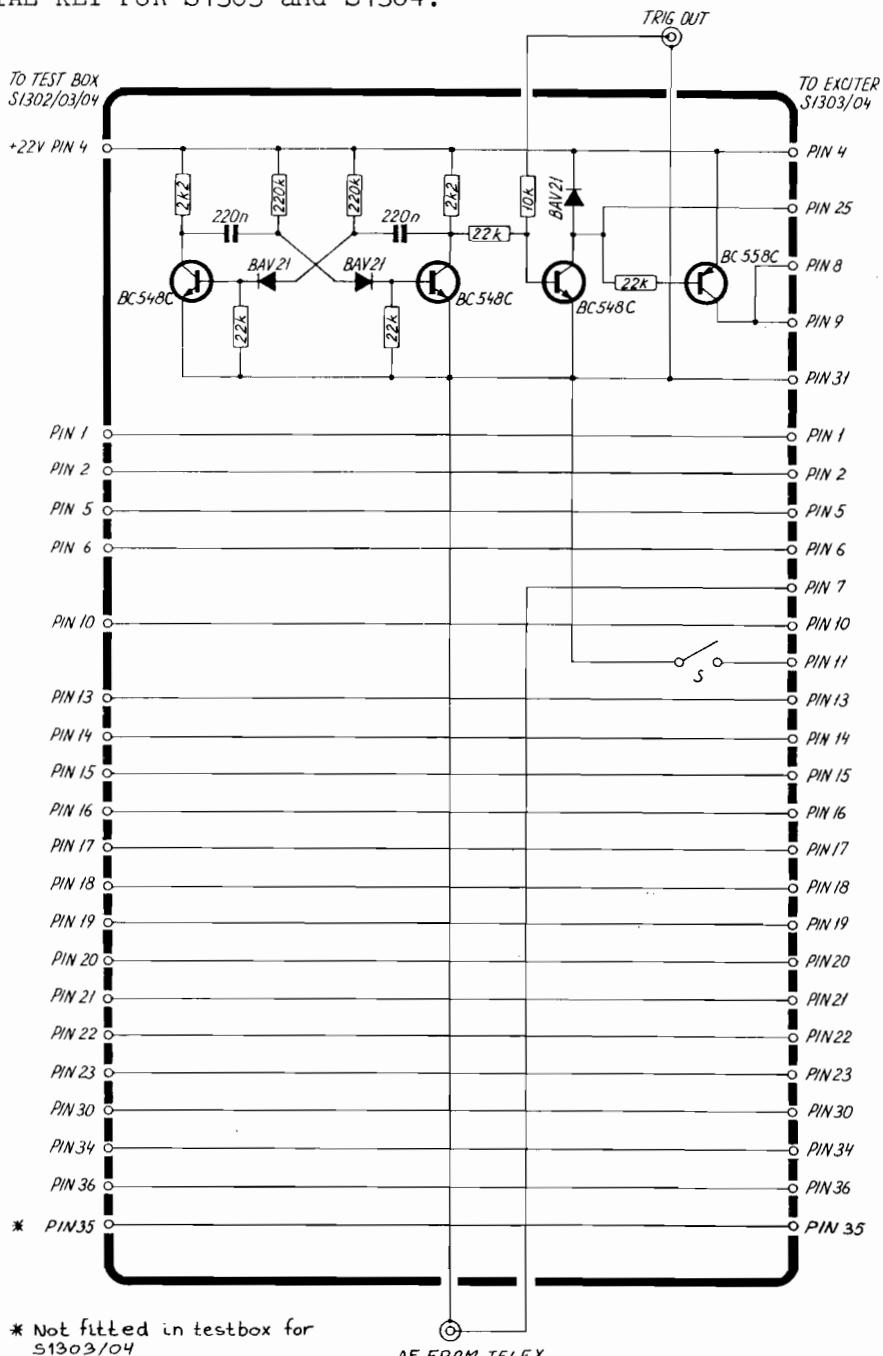

TRANSMITTER START: The diode is alight when handset key is activated, when TUNE, and in SEND ALARM.
In S1303/04 the diode is alight in TELEX and in TELEGRAPHY.

PA BLOCK: The diode is alight when dummy and 2182 kHz is chosen at the same time and the diode will flash once when dummy load is chosen.

SIMPLEX RELAY: The diode is alight when TUNE is activated in 2182 kHz + handset key is on, and in SEND ALARM.

NECESSARY TEST EQUIPMENT cont.:

ARTIFICIAL KEY FOR S1303 and S1304.

The ARTIFICIAL KEY is designed to connect between the EXCITER S1303/04 and the TESTBOX S1302/03/04. The necessary wires are fed through to the TESTBOX S1302/03/04 and a multivibrator keys via two transistors the exciter in the telex and telegraphy mode. The key frequency is approx. 15 Hz. An output TRIG OUT taken from the multivibrator can be used to trig an oscilloscope. An input terminal can be used to feed an AF signal into the exciter to modulate it in TELEX mode.

The switch on the front plate of the ARTIFICIAL KEY is together with the square wave on pin 25 used to test the external frequency read in.

51303/04
4-0-23880

3. TROUBLE-SHOOTING

Trouble-shooting should only be performed by persons with sufficient technical knowledge, who have the necessary test equipment at their disposal, and who have carefully studied the operation principles and structure of the unit in question

Start to find out whether the fault is somewhere in the antenna circuit, the power source, or in the short wave set.

When the fault has been located to a certain unit look up the PERFORMANCE CHECK list in the instruction book and make relevant performance check to incircle the fault. Then look up the CIRCUIT DESCRIPTION. This section contains schematic diagrams, description of the modules and pictures showing the location of the components. (ADJUSTMENT LOCATIONS).

Typical AC and DC voltages are indicated on the schematic diagrams.

No adjustment must take place unless the service workshop has the necessary test equipment to perform the ADJUSTMENT PROCEDURE in question.

After repair or replacement of a module look up the section NECESSARY ADJUSTMENT AFTER REPAIR to see, whether the unit has to be adjusted or not.

The unit has to have a complete FUNCTION CHECK after repair.

TROUBLE-SHOOTING IN THE FREQUENCY GENERATING CIRCUIT

LOOP 1

If the fault has been located to Loop 1 the following hints can be used for trouble-shooting.

If there is no output signal from the VCO the fault has to be found in the VCO unit.

If the output frequency from the VCO is lower than the low frequency limits or higher than the high frequency limits of the 2 MHz band in question, the phase-locked Loop 1 is out of lock. For VCO frequencies look-up the section PRINCIPLE OF OPERATION.

1. Check the Loop 1 mixer output signal on the terminal "Loop 1 out".
 - a. If there is no output signal, the failure is on Loop 1 mixer, harmonic filter unit or VCO unit.
 - b. If the output frequency is approx. 2 MHz or approx. 5 MHz, the VCO unit Loop 1 mixer and the harmonic filter unit are apparently ok.
2. Check that the frequency on the phase/frequency detector IC106, pin 1 is 1 kHz.

TROUBLE-SHOOTING cont.:

3. Check the Loop 1 programmable divider.

- a. If the frequency on the input terminal "Loop 1 in" is approx. 2 MHz and the frequency on the phase/frequency detector IC106, pin 3 is lower than 1 kHz, the programmable divider is apparently ok.
- b. If the frequency on the input terminal "Loop 1 in" is approx. 5 MHz and the frequency on the phase/frequency detector IC106, pin 3 is higher than 1 kHz, the programmable divider is apparently ok.

4. Check the phase/frequency detector IC106.

- a. Measure 1.5V DC on the terminal "PD1 (1.5V) out" on divider unit.
- b. If the input frequency on IC106, pin 3 is higher than 1 kHz and the DC voltage on the terminal "PD1 out" on divider unit is approx. 0.7V, the phase/frequency detector is apparently ok.
- c. If the input frequency on IC106, pin 3 is lower than 1 kHz and the DC voltage on the terminal "PD1 out" on divider unit is approx. 2.3V, the phase/frequency detector is apparently ok.

5. Check the integrator IC202 on Loop 1 filter & +18V supply unit.

- a. If the DC voltage on the terminal "PD1 in" is approx. 0.7V and the DC voltage on output terminal of IC202, pin 6 is approx. -4V, the integrator IC202 is apparently ok.
- b. If the DC voltage on the terminal "PD1" is approx. 2.3V and the DC voltage on the output terminal of IC202, pin 6 is approx. -17V, the integrator IC202 is apparently ok.

6. If the failure has not been found yet the 1 kHz loop filter IC201 and the wirings to the VCO must be checked.

LOOP 2

If the fault has been located to Loop 2 the following hints can be used for trouble-shooting.

If there is no output signal from the VCXO and Loop 2 filter on the terminal "VCXO out", the failure has to be found in the VCXO.

If the output frequency from the VCXO and Loop 2 filter on the terminal "VCXO out" is lower than 10.098 MHz or higher than 10.099 MHz, the phase-locked Loop 2 is out of lock.

1. Check the output signal on VCXO and Loop 2 filter terminal "Loop 2 out".
 - a. If there is no output signal, the failure is in the Loop 2 mixer or the 10 MHz injection signal is missing.
 - b. If the output frequency is slightly lower than 98 kHz or slightly higher than 99 kHz, the VCXO, Loop 2 mixer and the 10 MHz injection signal are apparently ok.
2. Check that the frequency on the phase/frequency detector IC113, pin 1 is 100 Hz.

S1302/03/04 A8/2

TROUBLE-SHOOTING cont.:

3. Check the Loop 2 programmable divider.
 - a. If the frequency on the input terminal "Loop 2 in" is approx. 97 kHz and the frequency on the phase/frequency detector IC113, pin 3 is slightly lower than 100 Hz, the programmable divider is apparently ok.
 - b. If the frequency on the input terminal "Loop 2 in" is approx. 100 kHz and the frequency on the phase/frequency detector IC113, pin 3 is slightly higher than 100 Hz, the programmable divider is apparently ok.
4. Check the phase/frequency detector IC113.
 - a. Measure 1.5V DC on the terminal "PD2 (1.5V)" on the divider unit.
 - b. If the input frequency on IC113, pin 3 is lower than 100 Hz and the DC voltage on the terminal "PD2 out" on divider unit is approx. 0.7V, the phase/frequency detector is apparently ok.
 - c. If the input voltage on IC113 is higher than 100 Hz and the DC voltage on the terminal "PD2 out" on divider unit is approx. 2.3V the phase/frequency is apparently ok.
5. Check the integrator IC601 on VCXO and Loop 2 filter.
 - a. If the DC voltage on the terminal "PD2 in" is approx. 0.7V and the DC voltage on output terminal of IC601, pin 6 is approx. 17V, the integrator IC601 is apparently ok.
 - b. If the DC voltage on the terminal "PD2 in" is approx. 2.3V and the DC voltage on the output terminal of IC601, pin 6 is approx. 1V, the integrator IC601 is apparently ok.
6. If the failure has not yet been found the 100 Hz loop filter must be checked.

4. PERFORMANCE CHECK FOR S1303/04

Before executing the performance check the exciter must be connected to the power supplies +22V, +8V, and -45V (N1405) via the testbox S1303/04 and the artificial key for S1303/04. These two test boxes must be connected in series. The RF output connector must be loaded with 50 ohm.

It is necessary to change the proms IC702, IC2114, IC2115 with the supplied test proms.

The test proms have the following check sums: IC702 "OFDA", IC2114 "D674", IC2115 "DD6C".

The following performance check steps start with the selected frequency and the selected modulation mode of the exciter, e.g. A1, tune.

4.1. DC CONTROL

4.1.1.
Connect voltmeter to TP1.

4.1.2.
Check the voltage to be within 18V
+/-0.2V.

4.1.3.
Connect voltmeter to TP2.

4.1.4.
Check the voltage to be within -18V
+/-0.2V.

4.1.5.
Connect voltmeter between TP1 and
TP3.

4.1.6.
Check the voltage to be within 100
mV.

4.1.7.
Connect voltmeter to TP31.

4.1.8.
Check the voltage to be within 5V
+/-0.2V.

4.1.9.
Connect voltmeter to TP33.

4.1.10.
Check the voltage to be within 5V
+/-0.2V.

4.2. TCXO CONTROL

4.2.1.
Connect frequency counter to TP4.

4.2.2.
Check the frequency to be within 10
000 000 Hz +/-1 Hz.

4.3. KEYBOARD AND DISPLAY.

4.3.1.
Press the keyboard C, the display
shows 000000.

4.3.2.
Press the keyboard 1 six times. The
display shows 111111.

4.3.3.
Repeat 4.3.2. for 0.2.3.4.....
and 9.

4.3.4.
Press the keyboard point. The display
shows 99999.0.

4.3.5.
Press the keyboard 9. The display
shows 99999.9.

4.3.6.
Check that the illegal frequency lamp
is illuminated.

4.3.7.
Set the switch on the artificial key
in position OFF.

4.3.8.

Set the display input switch in position EXT.FRQ.CONTROL.

4.3.9.

Check that the display is empty except for the point, and that the EXT.FRQ.CONTROL lamp is illuminated.

4.3.10.

Set the switch on the artificial key in position ON.

4.3.11.

Check that the display shows 00000.0.

4.3.12.

Set the display input switch in position 2182 kHz selected.

4.3.13.

Check that the display shows 02182.0.

4.3.14.

Set the display input switch in position keyboard.

4.4.

VCO SELECTOR:

The band select output code is controlled.

4.4.1.

Set the frequency to 8500.0 kHz.

4.4.2.

Check that the diodes on the testbox indicates the code

ZYXVZ
01010

where a "1" represents an illuminated diode.

4.4.3.

Set the frequency to 19000.0 kHz.

4.4.4.

Check that the diode on the testbox indicates the code.

ZYXVZ
10101

where a "1" represents an illuminated diode.

4.4.5.

Set the frequency to 26000.0 kHz.

4.4.6.

Check that the 2182.0 kHz lamp is alight.

4.4.7.

Activate the key switch on the testbox.

4.4.8.

Check that the transmitter starts and the simplex relay lamps are alight.

4.4.9.

Activate the 22V for dummy switch on the testbox.

4.4.10.

Check that the PA block lamp on the testbox is alight.

4.4.11.

Set the 22V for dummy switch in neutral position.

4.5.

HARMONIC FILTER AND VCO.

Load TP26 with 68 ohm.

4.5.1.

Connect frequency counter to TP30.

4.5.2.

Connect voltmeter to TP6.

Connect voltmeter to TP7.

4.5.3.

Go through the frequencies indicated in fig. 1 and check the above mentioned test points.

4.5.4.

In the A positions read 4698 kHz.

In the B positions read 2699 kHz.

4.5.5.

In all positions check that the TP6 voltage is below 3.5V.

4.5.6.

In A positions check that the TP7 voltage is 15V +/-1V and in B positions check that the TP7 voltage is above 5.0V.

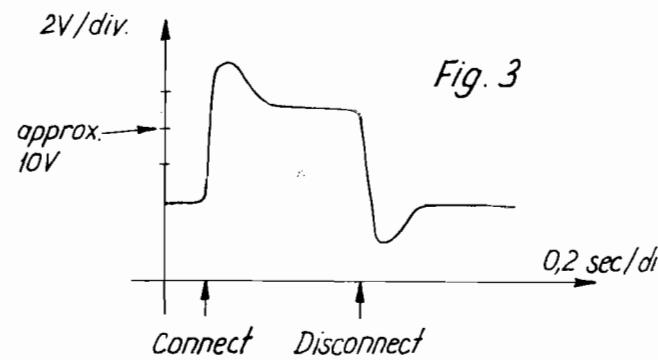

4.5.7.

Disconnect the 68 ohm load from TP26.

PERFORMANCE CHECK FOR S1303/04 cont.:

VCO under test	Pos.	Freq.select
L315	A	1999.0
	B	0000.0
L313	A	3999.0
	B	2000.0
L314	A	5999.0
	B	4000.0
L306	A	7999.0
	B	6000.0
L304	A	9999.0
	B	8000.0
L305	A	13999.0
	B	12000.0
L309	A	17999.0
	B	16000.0
L307	A	23999.0
	B	22000.0
L308	A	25999.0
	B	24000.0

Fig. 1

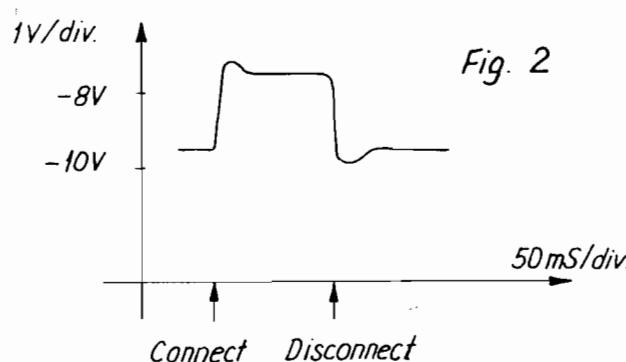

4.6.
STEP RESPONSE.

4.6.1.
Connect oscilloscope to TP7.

4.6.2.
Set the frequency to 2400.9 kHz, short-circuit black/yellow control wire on divider board to ground. Step response is seen on oscilloscope, compare to fig. 2.

4.6.3.
Connect oscilloscope to TP8.

4.6.4.
Set the frequency to 2400.9 kHz, short-circuit grey control wire on divider board to ground. Step response is seen on oscilloscope, compare to fig. 3.

4.7.
LEVEL CHECK

4.7.1.
Connect oscilloscope to TP29 via 1:10 probe.

4.7.2.
Check the voltage to be above 1.7Vpp at the frequency 2000.5 kHz.

4.7.3.
Connect oscilloscope to TP27 via 1:10 probe.

4.7.4.
Check the voltage to be above 1.6Vpp at the frequency 2000.5 kHz.

4.7.5.
Connect oscilloscope to TP28 via 1:10 probe.

4.7.6.
Check the voltage to be above 2.5Vpp at the frequency 2000.5 kHz.

4.7.7.
Connect voltmeter to TP8.

4.7.8.
Check the voltage to be within 6V to 11V at the frequency 2000.5 kHz.

4.7.9.
Check the voltages to be below 14.5V at the frequency 2000.0 kHz.

4.7.10.
Check the voltage to be above 4V at the frequency 2000.9 kHz.

**4.8.
MICROPHONE AMPLIFIER.**

4.8.1.
Connect oscilloscope to TP12.

4.8.2.
Set the frequency to 2000.5 kHz and the mode switch to A3J (J3E), connect the tone generator (1000 Hz) to the testbox.

4.8.3.
Adjust the tone generator output voltage from a minimum, until the level at TP12 is just constant. This limitation must happen at approx. 1Vpp measured at TP25.

4.8.4.
Add 10 dB to tone generator (3.16Vpp) and check that the measured signal is approx. symmetrical clipped.

4.8.5.
The attack- and decay time of the microphone amplifier is measured on TP24, connect the oscilloscope to this TP.

4.8.6.
By connection and disconnection of the tone generator signal the measured voltage must be as shown on fig. 4a and b.

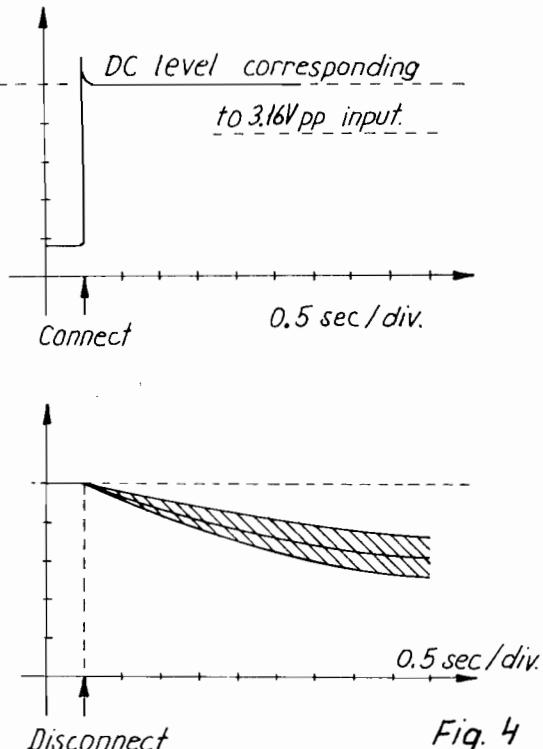

Fig. 4

**4.9.
OUTPUT LEVEL**

4.9.1.
Connect oscilloscope to TP21 via 1:10 probe.

4.9.2.
Set the frequency to 2000.5 kHz, tune, full power and power level potentiometer fully clockwise. Measure the output voltage to be within 4.2Vpp and 4.8Vpp.

4.9.3.
With the tune button activated, control that the tune lamp on the front plate is alight, and that the SIMPLEX RELAY lamp on the testbox is alight.

4.9.4.
Connect TP24 to ground.

4.9.5.
Press the tune button and adjust the power level potentiometer until there is full deflection (8 cm) on the oscilloscope. The output signal is symmetrical clipped.

4.9.6.
Disconnect TP24 from ground, the output signal seen on the oscilloscope is 7 cm and the signal is not clipped.

**4.10.
POWER REDUCTION.**

4.10.1.
Connect diode probe to TP21.

4.10.2.
Set the frequency to 2.000,0 kHz, A3H (H3E), full power, and activated key, check that the power level potentiometer on the testbox can change the output RF level between 10 and 13 dB.

4.10.3.
With power level potentiometer on the testbox fully clockwise, check the first power reduction step to be between 4 dB and 6 dB below full power, the second step 8 dB, the third step 12 dB to 18 dB and the fourth step 17 dB to 23 dB below full power.

S1303/4 A7/5

4.10.4.

Check that the power reduction lamp is alight when the output power is reduced.

4.11.

A3H, A3A, A2H, A1 and TELEX.

4.11.1.

Connect oscilloscope to TP21 via 1:10 probe.

4.11.2.

Select 2000.5 kHz, tune and full power, adjust power level potentiometer until there is full deflection (8 cm) on oscilloscope screen.

4.11.3.

Change to A3H without modulation. Check A3H carrier, now seen to be within 4 cm and 5 cm.

4.11.4.

Connect tone generator, 1000 Hz and 3Vpp to microphone plug.

4.11.5.

Check the output in A3H, A3A, A2H and A3J to be within 7 cm pp. and 8 cm pp. on oscilloscope.

4.11.6.

Check the output in A1 to be within 5 cm pp. and 6.4 cm pp. on the oscilloscope.

4.11.7.

Select 2000.5 kHz and A3J. Connect tone generator, 1500 Hz and 3Vpp to the microphone plug and adjust the output level to full deflection (8 cm) on the oscilloscope screen. Connect tone generator to the artificial key.

4.11.8.

Select 2000.5 kHz and telex, and check that the peak amplitude of the output signal is within 7 cm pp. and 8 cm pp. on the oscilloscope.

4.11.9.

Connect pin 3 and pin 8 on IC1001 (mode switch board) and check that the peak amplitude of the output signal is within 5 cm pp. and 6 cm pp.

4.11.10.

Remove the pin 3 and pin 8 connection and press the tune knob for 10 secs.

4.11.11.

Check that the peak amplitude of the telex signal again is 7-8 cm pp.

4.12.

A2H OSCILLATOR AND DELAY UNIT.

4.12.1.

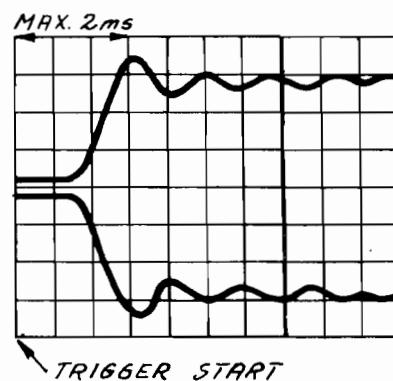

Connect frequency counter to TP32, and check the frequency to be within 455 Hz to 475 Hz in A2H position.

4.12.2.

Connect oscilloscope to TP21, and tone generator to the artificial key. Tone generator output: 1500 Hz and 3Vpp.

4.12.3.

Select 2000.5 kHz and telex, trig the oscilloscope from the artificial key, and check the output envelope on the oscilloscope with the figure below.

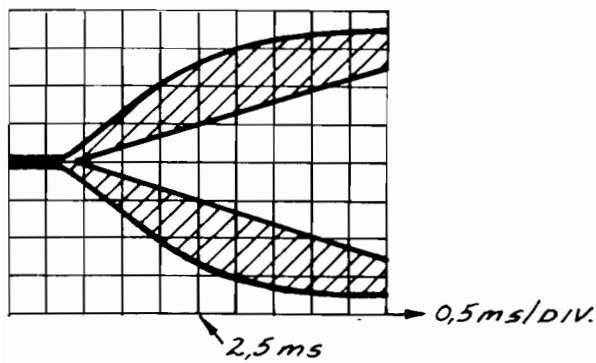

4.12.4.

Select 2000.5 kHz, A1 and oscilloscope sensitivity to 0.1V/div., adjust power level potentiometer until the steady state level is 8 cm pp. on the screen.

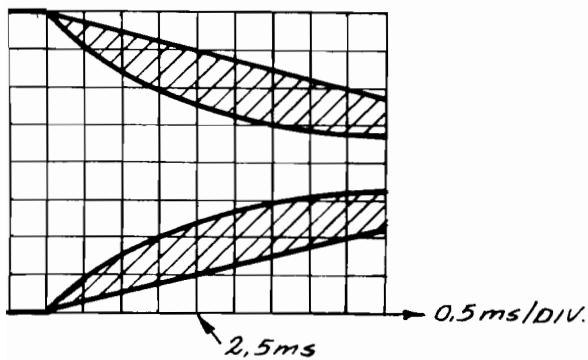

4.12.5.

Trig the oscilloscope from the artificial key and check the output envelope on the oscilloscope with the figure below.

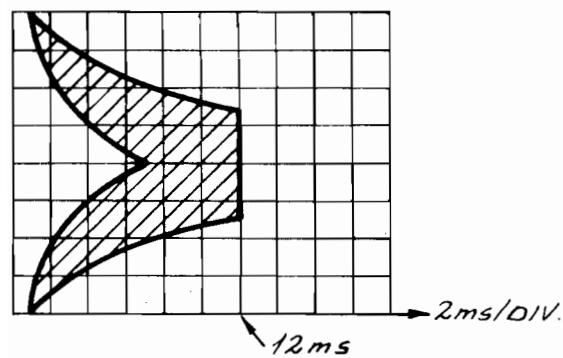

4.12.6.

Trig the oscilloscope on the opposite edge and check the output envelope with the figure below.

4.12.7.

Change sweep rate to 2 mS/div. and check the +22V from delay as indicated on the figure below.

4.12.8.

Connect the oscilloscope to TP35 and trig the oscilloscope from the artificial key. Load TP35 with 1 kohm.

4.12.9.

Check that the RX block pulse stays at +22V for a time period between 6 msec and 20 msec after key-off.

4.13.

BANDPASS FILTER UNIT

Lowpass filters and bandpass filters are checked as described in adjustment procedure 5.11.

4.14.

ALARM TONE GENERATOR

4.14.1.

Connect oscilloscope to TP22 via 1:10 probe.

4.14.2.

Activate the alarm test button. On the oscilloscope a 5.0Vpp square wave is seen. Control that the frequency is 2.0 Hz (500 msec).

4.14.3.

Connect oscilloscope to TP11 via a 1:10 probe.

4.14.4.

Activate the alarm test button. Control that a voltage of 22V DC with a 1.2Vpp square wave is seen on the scope.

4.14.5.

Connect the counter to TP11 via 1:10 probe.

4.14.6.

Connect TP22 to ground (pin 8 of IC1308). Check the frequency to be 1300 Hz +-10 Hz.

4.14.7.

Connect TP22 to +5V DC (pin 14 of IC1304). Check the frequency to be 2200 Hz +-15 Hz.

Under the performance check that the alarm tone generator will stop after 45 secs. For restart, release test alarm push button and activate it again.

PERFORMANCE CHECK FOR S1303/04 cont.:

4.15.

FREQUENCY RESPONSE

Frequency responses from LF input (on testbox) to the RF output is measured as described in adjustment procedure 5.9.1. and 5.9.3.

FREQ. (MHz)

2888.8
4444.4
12300.0
22200.0
25000.0
5999.0
16799.0

4.16.

DISTRESS

4.16.1.

Connect the oscilloscope to TP21. Switch the frequency to 2182.0 kHz.

4.16.2.

Press alarm and test alarm at the same time.

4.16.3.

The distress signal can now be seen on the oscilloscope. The time from start of alarm signal until it automatically disappears is checked by a watch to be approx. 45 secs. Control that the modulation index is at least 0.7.

4.16.4.

When the alarm tone signal is seen on the oscilloscope press the tune button and check that the peak to peak voltage now seen is approx. the same as that of the alarm tone signal.

4.17.

FREQUENCY SELECTION

4.17.1.

Change the proms IC702, IC2114 and IC2115 from the test prom to the prom supplied with the exciter.

4.17.2.

Press the A3H (H3E) button and disconnect the AF tone generator on the test box.

4.17.3.

Connect the frequency counter to TP21 via a 1:10 probe.

4.17.4.

With the frequencies shown below control the frequencies.

4.17.5.

Connect the oscilloscope to TP21 and switch the DISPLAY INPUT SWITCH to position 2182 selected.

4.17.6.

Control that the diode 2182 kHz selected is alight.

4.17.7.

Turn the POWER REDUCTION button counter clockwise and control by means of the oscilloscope that the power is not reduced and that the power reduction lamp is not alight.

4.17.8.

Set the DISPLAY INPUT SWITCH to position keyboard. Check that the illegal frequency lamp is alight.

4.17.9.

Set the frequency to 4125.0 kHz and check that the illegal frequency lamp is not alight.

4.18.

FREQUENCY CHECK (only S1304)

4.18.1.

Reconnect the plugs from the frequency, check unit on the frequency control unit.

4.18.2.

Key-in the frequencies of the frequency table placed beside the short wave set or in the operating instruction manual.

4.18.3.

Check that the illegal frequency lamp is not alight when an allowed frequency is keyed-in.

5. ADJUSTMENT PROCEDURE FOR S1303/04

Before executing adjustment procedure the exciter must be connected to the power supplies +22V, +8V and -45V via the testbox S1303/04 and the artificial key for S1303/04. These two test boxes are connected in series. The RF output connector must be loaded with 50 ohm.

It is necessary to change the PROM's IC702, IC2114, IC2115 with the supplied test points.

The following adjustment steps start with the selected frequency and the selected modulation mode of the exciter e.g. A1 tune.

The trimming cores are factory sealed. In order to break the seal - use normal cellulose thinner.

5.1. DC ADJUSTMENTS.

5.1.1.
Connect voltmeter to TP1.

5.1.2.
Adjust R902 to +18V.

5.1.3.
Connect voltmeter to TP2.

5.1.4.
Adjust R209 to -18V.

5.1.5.
Connect voltmeter between TP1 and TP3.

5.1.6.
Adjust R214 to less than 100 mV.

5.2. TCXO

5.2.1.
Connect frequency counter to TP4.

5.2.2.
Adjust R112 to 10 000 000 +-1 Hz.

5.3. VCO OSCILLATOR.

5.3.1.
Disconnect the VCO output coaxial cable and connect a 50 ohm resistor to the VCO output terminal (VCO OUT).

5.3.2.
Connect a voltmeter to VCO CONTROL IN.

5.3.3.
Turn the core of each coil to the level of the coil former.

5.3.4.
Select each VCO coil unit by keying-in the frequencies listed below.

5.3.5.
The VCO coil unit is adjusted by turning the core of the selected coil until voltage reaches the value -15.0V +-1V.

fTX (MHz)	VCO coil
1.999	L315
3.999	L313
5.999	L314
7.999	L306
9.999	L304
13.999	L305
17.999	L309
23.999	L307
25.999	L308

5.3.6.
Connect an oscilloscope to the 50 ohm resistor at the VCO output terminals.

5.3.7.
Key-in the frequencies listed below and control that the oscilloscope voltage is 1.5Vpp +-0.4Vpp and control that the voltmeter shows -8 +-2V DC.

ADJUSTMENT PROCEDURE FOR S1303/04
cont.:

f_{TX} (MHz)	VCO coil	5.4.10. Disconnect 68 ohm load.		
0.000	L315			
2.000	L313			
4.000	L314			
6.000	L306			
8.000	L304			
12.000	L305			
16.000	L309	1.999	8	L403
22.000	L307	3.999	10	L402
24.000	L308	5.999	12	L401
		7.999	14	L404
		9.999	16	L405
5.3.8.		13.999	20	L406
Disconnect the 50 ohm resistor at the VCO output terminals.		17.999	24	L407
Connect the VCO output coaxial cable again.		23.999	30	L409
		25.999	32	L408

5.4.
HARMONIC FILTERS.

5.4.1.
Load TP26 with 68 ohm.

5.4.2.
Connect voltmeter to TP7.

5.4.3.
Turn core of each coil to the level
of the coil former.

5.4.4.
Select each harmonic filter by
keying-in the frequencies specified
in 5.4.11.

5.4.5.
The harmonic filters are adjusted
by turning the core of the selected
coil until the voltage reaches the
value -15V +-1V.

5.4.6.
Connect voltmeter to TP6.

5.4.7.
Execute 5.4.11. and adjust each
selected coil to minimum voltage
(AGC-voltage). This voltage must
be 1.5V +-0.5V.

5.4.8.
Connect voltmeter to TP7.

5.4.9.
Execute 5.4.11. and check that the
voltage is -15V +-1V.

5.5.
MICROPHONE AMPLIFIER.

5.5.1.
2000.5 kHz, A3J (J3E). Connect tone
generator, 1000 Hz and 1Vpp measured
on TP25.

5.5.2.
Connect oscilloscope to TP12.

5.5.3.
Turn R1201 fully counter clockwise
and then clockwise until the
measured level is just constant.
OPTIMIZING OF POSITION

5.5.4.
Add 10 dB to tone generator output
1Vpp.

5.5.5.
Adjust R1224 for symmetrical
clipping.

5.5.6.
Connect oscilloscope to TP13.

5.5.7.
Change to tune position.

5.5.8.
Adjust R1232 to 80 mVpp.

ADJUSTMENT PROCEDURE FOR S1303/04
cont.:

5.6.
SIGNAL PATH.

5.6.1.
2000.5 kHz, A3J (J3E), handset key on, with no input from tone generator. Connect oscilloscope to TP9 via 1:10 probe.

5.6.2.
Adjust L101, L1101, and L1102 for max.

5.6.3.
Adjust R1125 and C1123 for min. This adjustment must be repeated until the measured signal is almost a 1.2 MHz Sine.

5.6.4.
Turn power level potentiometer fully clockwise.

5.6.5.
Connect oscilloscope to TP23 via 1:10 probe.

5.6.6.
Adjust R1625 to min.

5.6.7.
2000.5 kHz, tune full power. Connect oscilloscope to TP21 via 1:10 probe. If the signal is clipped reduce output until it is undistorted.

5.6.8.
Adjust L1106, L601, L1603 and L1604 for max.

5.6.9.
Connect oscilloscope to TP6 via 1:10 probe.

5.6.10.
Turn R1149 fully clockwise.

5.6.11.
Adjust R1158 until there is full deflection (8 cm) on oscilloscope screen. The signal seen on the oscilloscope is symmetrical clipped.

5.6.12.
Adjust R1149 until the deflection seen on the oscilloscope is 7 cm. The signal seen is not clipped.

5.6.13.
Connect oscilloscope to TP17 via 1:10 probe and set the output to max. by turning the power level meter fully clockwise.

5.6.14.
Adjust R1158 to 350 mVpp.

5.6.15.
Connect oscilloscope to TP20 via 1:10.

5.6.16.
Adjust R1631 to 2.8 Vpp.

5.6.17.
Connect oscilloscope to TP21 via 1:10 probe.

5.6.18.
Adjust R1534 to 4.5 Vpp.

5.6.19. (USA version only)
Connect oscilloscope to TP20 via 1:10 probe.

5.6.20. (USA version only)
Adjust R1631 to 1.4 Vpp.

5.6.21. (USA version only)
Connect oscilloscope to TP21 via 1:10 probe.

5.6.22. (USA version only)
Adjust R1534 to 4.5 Vpp.

5.7.
A3H AND A2H LEVEL.

5.7.1.
Connect frequency counter to TP32.

5.7.2.
2000.5 kHz, A2H. Adjust L1801 to 465 Hz +-5 Hz.

5.7.3.
2000.5 kHz, tune and full power. Connect oscilloscope to TP21 via 1:10 probe.

5.7.4.
Adjust power level potentiometer to full screen (8 cm).

ADJUSTMENT PROCEDURE FOR S1303/04
cont.:

5.7.5.

Change to A3H without modulation.
Adjust the A3H carrier now seen to
4.4 cm with R1109.

5.7.6.

Change to A2H and adjust R1806 until
the A2H signal now seen is 8 cm pp.

5.7.7.

Connect oscilloscope to TP35 and
trig the oscilloscope from the arti-
ficial key and load TP35 with 1
kohm.

5.7.8.

2000.5 kHz, A1. Adjust the voltage
now seen to be +22V for a time per-
iod of 10 mS +-1 mS on the potentio-
meter R1819.

5.8.

ALARM GENERATOR.

No adjustments to be executed. For
a performance check execute point
4.11 and 4.13.

The following filter adjustments
must only be carried out when some
repair is done around a filter.

5.9.

600 kHz SSB FILTER.

5.9.1.

2000.5 kHz, tune. Connect oscillo-
scope to TP21 via 1:10 probe.

5.9.2.

Adjust L1104 and L1105 for max.

5.9.3.

Control of filter response is car-
ried out in mode A3J (J3E), with
tone generator connected to the test
box, output 3Vpp measured on TP25.

Frequency response is measured with
diode probe on TP21. Max. permis-
sible ripple is 2 dB in the
frequency range 500 kHz - 2500 Hz,
-6 dB frequencies are approx. 350
Hz and 2700 Hz.

5.9.4.

2000.5 kHz, TUNE. Turn the power
level potentiometer fully clockwise.
Go through 5.6.9. - 5.6.22. and
5.7.1. - 5.7.3.

5.10.

10.7 MHz FILTER.

5.10.1.

598.0 kHz, A3H (H3E) without modula-
tion. Disconnect inner core of coax-
ial cable W1/6-16. 1 .

5.10.2.

Connect point 1 to point 5 on mixer-
board with an external wire.

5.10.3.

Connect oscilloscope to TP19 via
1:10 probe.

5.10.4.

Adjust L1601 and L1602 to max.

5.10.5.

Adjust slightly L1601 and/or L1602
until the amplitude is the same
within +-0.25 dB at the frequencies
595.0 kHz, 598.0 kHz and 601.0 kHz.

5.10.6.

Remove wire between 1 and 5 , re-
connect W1/6-16.

5.10.7.

2000.5 kHz, tune. Turn the power
level potentiometer fully clockwise,
Go through 5.6.7. to 5.6.8. without
the adjustment of L1106 and L601,
and go through 5.6.13. - 5.6.22.

5.11.

LOWPASS FILTER AND BANDPASS FILTER
UNIT.

5.11.1.

4500.0 kHz, A3H (H3E) without modula-
tion. Disconnect the 50 ohm load
at the RF output terminal and con-
nect an oscilloscope to TP21 via
a 1:1 probe.

ADJUSTMENT PROCEDURE FOR S1303/04
cont.:

5.11.2.

Disconnect the inner core of coaxial cable W1/15-16. Connect the inner core of coaxial cable W1/3-16 (the VCO-signal) to the point where the inner core W1/15-16 was connected.

5.11.3.

With max. sensitivity on the oscilloscope adjust L1501 to min. output voltage.

5.11.4.

Set the frequency to 9999.9 kHz.

5.11.5.

Adjust L1502 to min. output voltage.

5.11.6.

Reconnect the wires W1/15-16 and W1/3-16.

5.11.7.

6600.0 kHz, A3H (H3E) without modulation.

5.11.8.

Adjust L1503 to max. output voltage.

5.11.9.

9000.0 kHz, A3H (H3E) without modulation.

5.11.10.

Adjust L1504 to max. output voltage.

5.11.11.

Reconnect the 50 ohm load at the RF output terminal.

5.11.12

1600.0 kHz, A3H (H3E) without modulation, connect diode probe to TP21.

5.11.13.

Adjust power level potentiometer until 0.775V, corresponding to 0 dB on the decibel scale, is attained.

Set the frequency to 1800.0, 2400.0, 4299.0 and 6600.0 kHz and control that the output difference does not exceed 0.6 dB.

5.11.14.

8500.0 kHz, A3H (H3E) without modulation. Control that the output voltage is between -1 dB and +0.5 dB with reference to the adjustment in 5.11.13.

5.11.15.

A3H (H3E) without modulation.

5.11.16.

Set the frequency to A = 12330.0 kHz, B = 12491.0 kHz and C = 12652.0 kHz and execute 5.11.20.

5.11.17.

Set the frequency to A = 16460.0 kHz, B = 16660.0 kHz and C = 16859 kHz, and execute 5.11.20.

5.11.18.

Set the frequency to A = 22000.0 kHz, B = 22156.0 kHz and C = 22311.0 kHz, and execute 5.11.20.

5.11.19.

Set the frequency to A = 25070.0 kHz, B = 25090.0 kHz and C = 25110.0 kHz, and execute 5.11.20.

5.11.20.

The frequencies for the bandpass filter adjustments is chosen so that the center frequency is in position B, and band limits in position A and C.

Every single bandpass filter must be adjusted to max. output. The output must be within +/-0.25 dB in A and C relative to B and the deflection on the center frequency position B must be between -1.0 dB and +0.5 dB with reference to the adjustment in 5.11.13.

5.11.21.

1A TUNE. Turn the power level potentiometer fully clockwise. Go through 5.6.15. - 5.6.22.

5.12.

OUTPUT FILTER.

5.12.1.

0000.0 kHz, A3H (H3E) without modulation. Connect oscilloscope to TP21 via 1:1 probe (wire).

ADJUSTMENT PROCEDURE FOR S1303/04
cont.:

5.12.2.

Disconnect the inner core of coaxial cable 2 W1/15-16. Connect the inner core of coaxial cable 5 W1/3-16 (the VCO signal) to the point where the inner core 2 W1/16-15 was connected.

5.12.3.

Connect the 6 brown/black wire to the 4 red/black wire on the band filter board.

5.12.4.

Turn the potentiometer R1534 fully counter clockwise.

5.12.5.

Adjust L1404, L1403 and L1401 to min. output voltage. This adjustment must be repeated until the measured signal is almost a 21.4 MHz sine signal.

5.12.6.

Reconnect the wires of point 5.12.2.
- 5.12.3. at their proper place.

5.12.7.

2000.5 kHz, TUNE. Turn the power level potentiometer fully clockwise. Go through 5.6.17. - 5.6.22.

A6/6

S1303/4

5.13.

VCO FILTER (only in USA).

5.13.1.

13.999,0 kHz, A3J (J3E). Connect oscilloscope to the inner core of coaxial cable 5 W1/3-16 (the VCO input to mixer unit).

5.13.2.

Disconnect the wires connected to the 6 MHz LP and 9 MHz LP on the VCO filter unit and connect the 6 MHz LP terminal to +18V DC.

5.13.3.

Adjust L2204 to minimum output.

5.13.4.

Set the frequency to 23300.0 kHz.

5.13.5.

Adjust L2202 to minimum output.

5.13.6.

Set the frequencies to 1600.0 kHz and 8500.0 kHz and control that the VCO signal is not attenuated through the VCO filter.

5.13.7.

Reconnect the wires of point 5.13.2. at their proper place.

6. NECESSARY ADJUSTMENTS AFTER REPAIR FOR S1303/04

In the following paragraphs is referred to the necessary adjustment - and performance check paragraphs in chapter 4 and 5.

6.1.

DIVIDER UNIT

Execute 4.1.7. - 4.1.18, 5.2. and adjust L101 as described in 5.6.1. and 5.6.2. Check 4.6., 4.9., 4.16. and 4.17.1. - 4.17.4.

6.8.

MODE SWITCH

Perform a FUNCTION CHECK 7.

6.2.

LOOP 1 FILTER & +-18V POWER SUPPLY

Execute 5.1.

Check 4.5., 4.6.1. and 4.6.2.

6.9.

SSB GENERATOR

Execute 5.6. without adjusting L101, L601, L1603 and L1604.

Execute 5.7.

6.3.

VCO UNIT OR LOOP 1 MIXER

Execute 5.3.

Check 4.5., 4.6.1. - 4.6.2. and 4.17.1. - 4.17.4.

6.10.

MICROPHONE AMPLIFIER

Execute 5.5., 5.6.9. - 5.6.22. and 5.7.

Check 4.8.

6.4.

HARMONIC FILTER

Execute 5.4.

Check 4.5. and 4.17.1. - 4.17.4.

6.11.

ALARM SIGNAL GENERATOR

Check 4.14. and 4.16.

6.5.

VCXO AND LOOP 2 FILTER

Execute 5.6.7. - 5.6.8. without adjusting L1106, L1603 and L1604.

Execute 5.6.15. - 5.6.22.

Check 4.6.3. - 4.6.4.

Check 4.7.5. - 4.7.10.

6.12.

OUTPUT FILTER

Execute 5.12.

6.13.

LP AND BP FILTER

Execute 5.11. and 5.6.15. - 5.6.22.

Check 4.17.1. - 4.17.4.

6.6.

VCO SELECTOR

Check 4.4. and 4.17.1. - 4.17.4.

6.14.

MIXER UNIT

Execute 5.6.4. - 5.6.22. without adjusting L1106 and L601.

6.7.

FILTER BOARD

Execute 5.1.1., 5.1.2., 5.1.5. and 5.1.6.

6.15.

A2H, OSCILLATOR AND DELAY UNIT

Execute 5.7. without adjusting R1109.

NECESSARY ADJUSTMENTS AFTER REPAIR FOR S1303/04 cont.:

6.16.

FREQUENCY CONTROL

Check 4.1.9. - 4.1.10, 4.3. and 4.17.
and perform a FUNCTION CHECK 7.

6.17.

POWER SWITCH

Perform a FUNCTION CHECK 7.

6.18.

VCO FILTER (only USA version)

Execute 5.13. and perform a FUNCTION
CHECK.

6.19.

KEYBOARD

Check 4.3. and perform a FUNCTION
CHECK 7.

6.20.

FREQUENCY CHECK

Check 4.18. and perform a FUNCTION
CHECK 7.

7. FUNCTION CHECK FOR S1303/04

7.1.1.

Connect the testbox S1303/04 and the artificial key S1303/04 to the exciter. Connect the power supplies and an AF tone generator to the testbox. The RF output connector must be loaded with 50 ohm.

7.1.2.

Connect the frequency counter to the RF output connector via 1:10 probe.

7.1.3.

Set exciter to A3H (H3E) full power, power level potentiometer on testbox fully clockwise and no modulation. Set the handset key placed on the testbox in position ON.

7.1.4.

Measure the RF output carrier frequency one in each band but in the CT band one frequency below and one frequency above 2 MHz.

Compare the measured frequencies to the frequency table, placed beside the short wave set or in the operating instruction manual.

The frequency accuracy must be within 1.0 ppm.

7.2.1.

Connect a diode probe to the RF output connector.

7.2.2.

Change to TUNE position and set the handset key on the testbox in off position.

7.2.3.

Go through the above mentioned channels and check the RF output voltage to be 3.7V +0.3V.

7.2.4.

In tune position the tune lamp must be alight. The transmitter start - and simplex relay lamp on the testbox must be alight.

7.2.5.

Check that the power level potentiometer on the testbox has a control range of approx. 12 dB.

7.2.6.

Change to A3H (H3E).

With the power level potentiometer on the testbox fully clockwise, set the handset key on the testbox in ON position.

Check the first power reduction step to be between 4 dB and 6 dB below full power, the second step 8 dB to 12 dB, the third step 12 dB to 18 dB and the fourth step 17 dB to 23 dB below full power.

7.2.7.

Check that the power reduced lamp is alight when the power is reduced.

7.2.8.

Check that the power reduced switch is disabled when tune is activated.

7.3.1.

Change to A3J (J3E). Choose a channel in the CT band.

7.3.2.

Supply 1500 Hz and 3.16V RMS to the AF input plug on the testbox S1303/ S1304.

7.3.3.

Adjust the power level potentiometer on the testbox until the meter deflection (diode probe connected to the RF output) is 2.45V corresponding to 0.0 dB.

7.3.4.

Change the AF tone generator frequency between 500 Hz and 2500 Hz, and check that the output amplitude ripple is below 2 dB.

Check that -6 dB frequencies are approx. 300 Hz and 2700 Hz.

7.3.5.

Set AF tone generator to 1500 Hz.

7.3.6.

Disconnect the diode probe and connect the oscilloscope to the RF output connector.

7.3.7.

Change to tune position.

FUNCTION CHECK FOR S1303/04 cont.:

7.3.8.

Adjust the power level potentiometer on the testbox until full deflection is seen on the oscilloscope screen (8 cm pp.).

7.3.9.

Check that the amplitude is within 7 cm pp. and 8 cm pp. in the positions A3J (J3E), A3H (H3E) and A3A (R3E).

7.3.10.

Supply 1500 Hz and 3.16V RMS to the AF input connector on the artificial key S1303/04.

7.3.11.

Check that the peak amplitude is within 7 cm pp. and 8 cm pp. in the positions TELEX and A2H. It can be necessary to activate the tune button a short moment.

7.3.12.

Check that the peak amplitude is within 5 cm pp. and 6 cm pp. in the position A1.

7.4.1.

Set the display input switch in position 2182 kHz selected.

7.4.2.

Press SEND ALARM and TEST ALARM at the same time. The distress signal can now be seen on the oscilloscope. The time from start of alarm signal until it automatically disappears must be 45 secs.

7.4.3.

Check that the power reduced switch is disabled under alarm transmission.

7.4.4.

Check that the 2182 kHz selected lamp is alight when the frequency selector is in position 1.

7.5.1.

Set the data/clock switch on the artificial key in position OFF.

7.5.2.

Set the display input switch in position EXT.FREQ.CONTROL.

7.5.3.

Check that the display is blank.

A2/2

S1303/4

7.5.4.

Set the data/clock switch on the artificial key in ON position.

7.5.5.

Check that the display is filled with zeroes.

7.6.1.

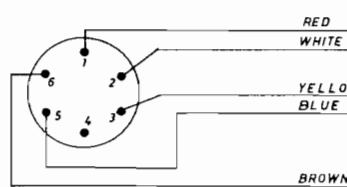

Check that the dimmer switch is working.

MICROTELEPHONE INSTALLATION S1300

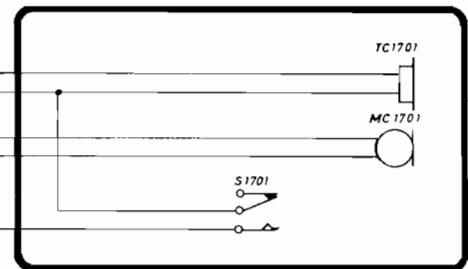

It is possible on request to get a special two microphone installation as described on the scematic diagram below.

NORMAL INSTALLATION WITH ONE MICROTELEPHONE

CIRCUIT DESCRIPTIONS AND SCHEMATIC DIAGRAMS

CIRCUIT DESCRIPTION FOR DIVIDER UNIT S130X

This unit contains the logic part of phase locked LOOP 1 and phase locked LOOP 2.

The 10 MHz reference oscillator (TCXO), reference divider, 2 MHz spectrum generator, 600 kHz carrier generator, programmable dividers for LOOP 1 and LOOP 2 and the phase/frequency detectors for LOOP 1 and LOOP 2.

10 MHz REFERENCE

The frequency stability of the exciter is related to the 10 MHz TCXO X0101. The 10 MHz reference signal is amplified in the transistors T103 and T104.

REFERENCE DIVIDER

The counters IC115, IC111 and IC107 divides the 10 MHz reference signal down to respectively $f_{R1} = 1 \text{ kHz}$ and $f_{R2} = 100 \text{ Hz}$.

2 MHz HARMONIC SPECTRUM GENERATOR

With a repetition frequency of 2 MHz the output Q_D of IC115 goes low and the nand-gates in IC114 will generate a narrow pulse due to the delay-time in the gates.

600 kHz GENERATOR

The output on IC111 pin 5, Q_B has a high contents of 600 kHz, which is amplified in the transistor T105 and filter in the tuned circuit L101, C136 and C137.

PROGRAMMABLE DIVIDER FOR LOOP 1

The variable frequency f_{T1} from LOOP 1 MIXER is amplified and shaped in T101 and IC109a. Independent of which 2 MHz band used the frequency f_{T1} will vary from 2699 kHz to 4698 kHz as the VCO varies 2 MHz. The programmable divider divides f_{T1} down to 1 kHz (dividing figure N_1). This means that there is 2000 frequencies in each 2 MHz band. The frequency is controlled by the FREQUENCY SELECTOR, which encodes the start figure P_1 into the BCD counters IC101, IC102, IC103 and IC104.

The stop figure S_1 is controlled from the gates IC108b and IC109c. When the counter outputs Q_A , Q_B ... etc. equals the stop figure $S_1 + 2$ the J-K flip-flop IC110b uses 2 clock pulses to load the start figure P_1 into the counters IC101, IC102, IC103 and IC104. The counter counts down from the start figure P_1 to stop figure S_1 and thus the dividing figure $N_1 = P_1 - S_1$.

LOOP 1 PHASE/FREQUENCY DETECTOR

The reference frequency $f_{R1} = 1 \text{ kHz}$ and the variable frequency $f_{V1} = 1 \text{ kHz}$ are fed into the phase/frequency detector IC106. The phase/frequency detector IC106 generates an error voltage, which is proportional to frequency or

phase difference between the two signals mentioned above. This error voltage is fed into the integrator on the LOOP 1 FILTER & ± 18V SUPPLY UNIT.

PROGRAMMABLE DIVIDER FOR LOOP 2

The variable frequency f_{T2} from the loop 2 mixer is amplified and shaped in T102 and IC109b. The frequency f_{T2} will vary between 98.1 kHz and 99.0 kHz depending on the 100 Hz programming. The programmable divider divides f_{T1} down to 100 Hz (dividing figure N_2).

From the FREQUENCY SELECTOR the start figure P_2 encodes into the BCD counter IC105.

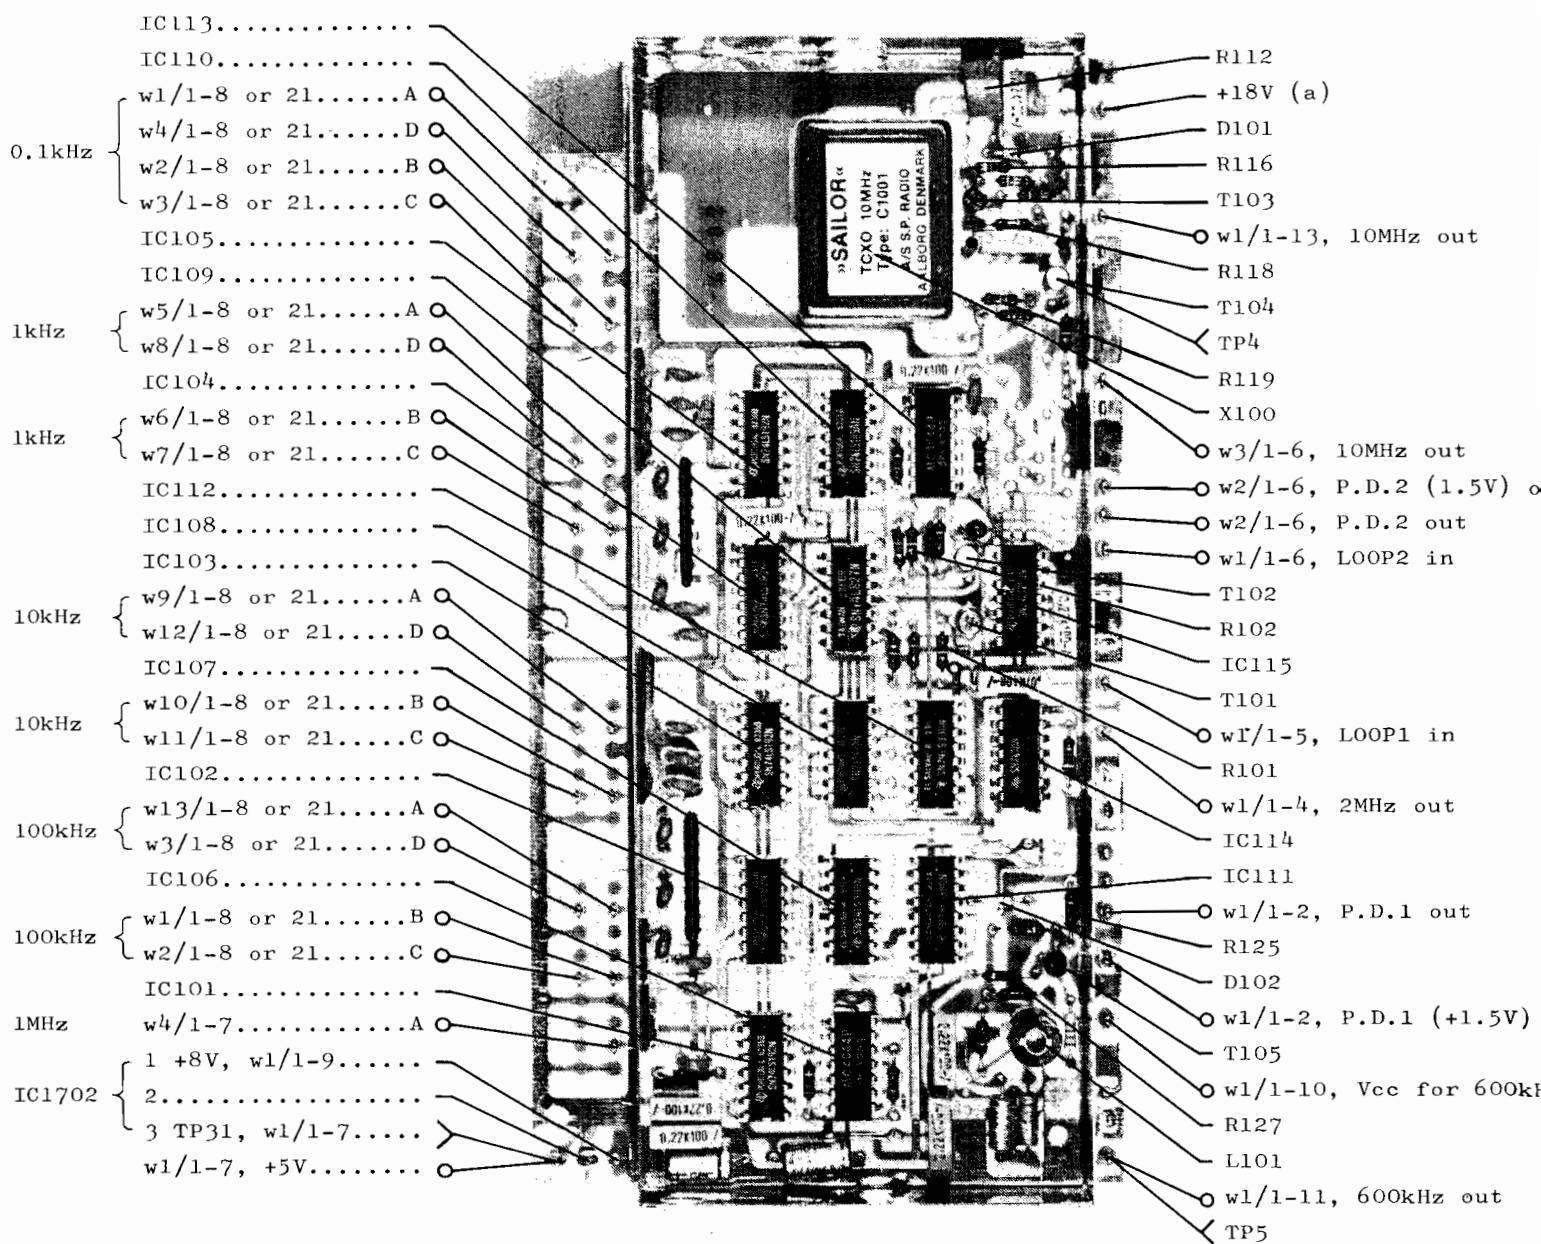

The stop figure S_2 is controlled from the gate IC108a. When the counter outputs Q_A , Q_B , Q_C ... etc. equals the stop figure $S_2 - 2$ the J-K flip-flop IC110a uses 2 clock pulses to load the start figure P_2 into the counters IC105 and IC112. The counter will count up from the start figure P_2 to the stop figure S_2 and thus the dividing figure is $N_2 = S_2 - P_2$.

LOOP 2 PHASE/FREQUENCY DETECTOR

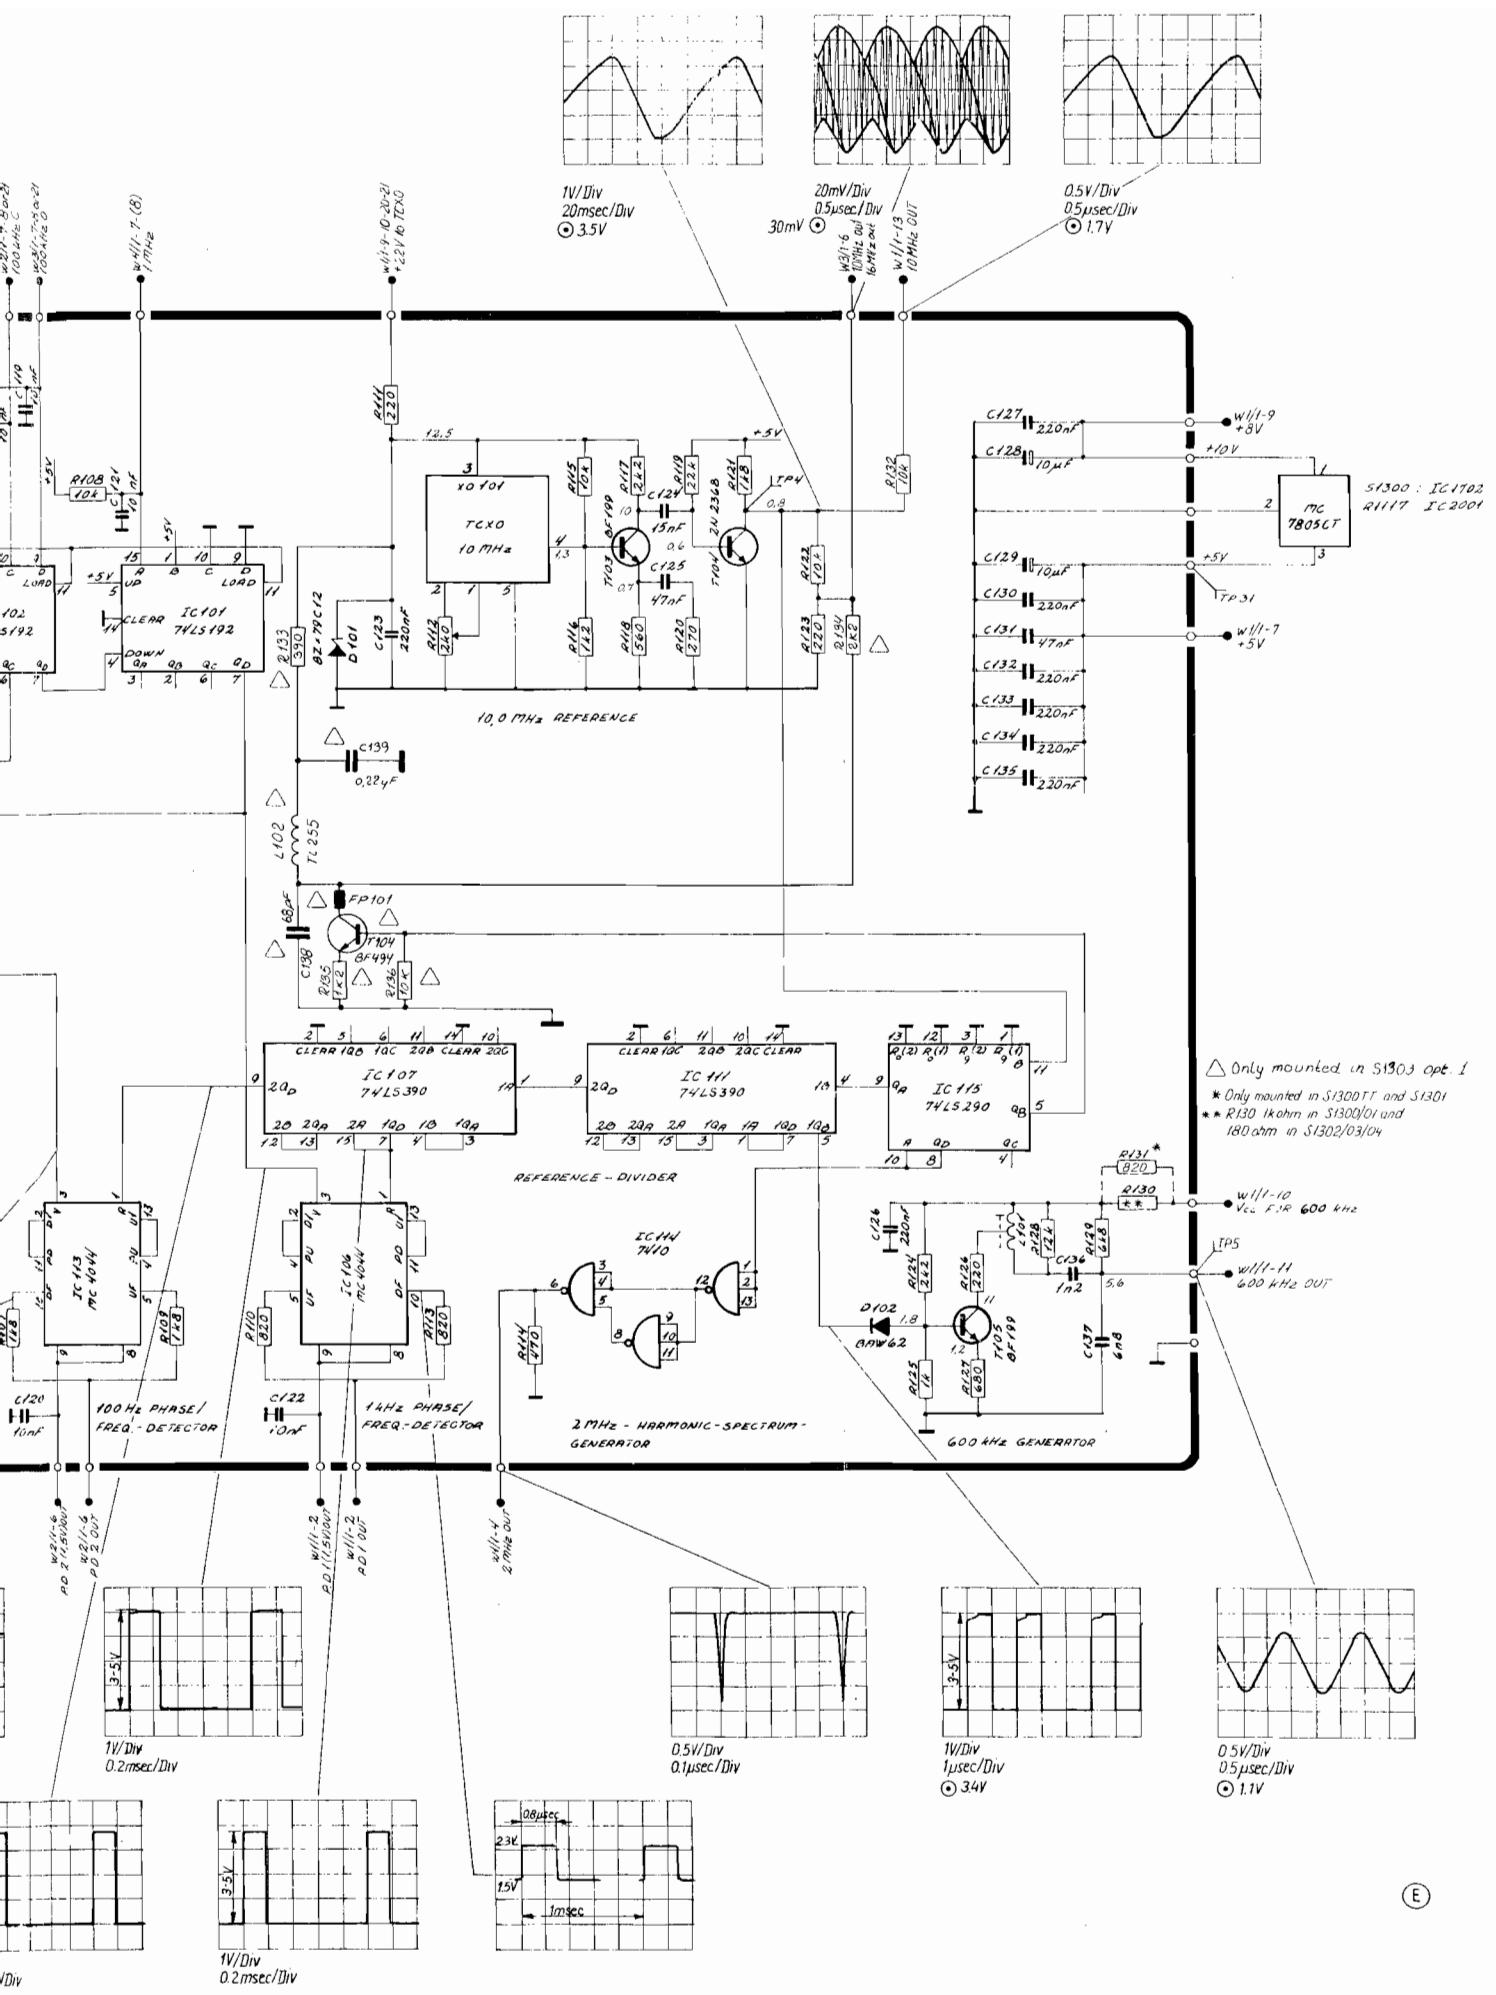

The reference frequency $f_{R2} = 100$ Hz and the variable frequency $f_{V1} = 100$ Hz are fed into the phase/frequency detector IC113. The phase/frequency detector IC113 generates an error voltage proportional to the frequency or the phase difference between the two signals mentioned above. This error voltage is fed into the integrator on the VCXO & LOOP 2 FILTER UNIT.

CIRCUIT DESCRIPTION LOOP 1 FILTER & \pm 18V SUPPLY UNIT S130X

This unit contains two regulated power supplies \pm 18V with fold-back current limiter, the complete integrator and filter for LOOP 1.

-18V SUPPLY

The series transistor T201 supplies a -18V output controlled by the current flow into its base from T205, where a portion of the output voltage, via a voltage divider containing R209, is compared to a reference voltage created by R204, D202 and D201. The fold-back is within the circuit. When the output current from the regulator increases the base current must increase too, but this current is limited by R204. When the regulator reaches this limit T205 stops conducting and so it folds back. To ensure that T201 starts conducting R203 is added.

+18V SUPPLY

The principle of operation for this regulator is exactly as described above, with an additional current limiter containing T204 and T206 to ensure the fold-back characteristic is maintained within design limits. To ensure start-up R212 is added.

INTEGRATOR & LOOP 1 FILTER

The integrator is built-up around IC202, the integration capacitor is C211. R220 feeds current into the diode coupled Darlington pair in the phase comparator MC4044 on the divider board to perform the 1.5V reference. Output from the integrator pin 6 on IC202 feeds into the active low-pass filter IC201 to filter out the 1 kHz ripple from the phase comparator. The voltage divider R217 and R218 connected to IC202 via D206 ensure that the output voltage swing is within approx. -4V to -17V.

CIRCUIT DESCRIPTION FOR VCO-UNIT S13XX

The VCO-unit comprises a common active negative resistance transistor-circuit and 9 parallel tuned circuits, which can be connected to the first mentioned circuit - one at a time - by means of diode switches. The negative resistance is generated by means of the feed-back around T301 and T302. When a parallel tuned circuit is connected to the collector of T301 by means of a pair of band switching diodes D326 to D334 and D338 to D340, the circuit will oscillate. Each coil section will cover an output frequency range of 2 MHz.

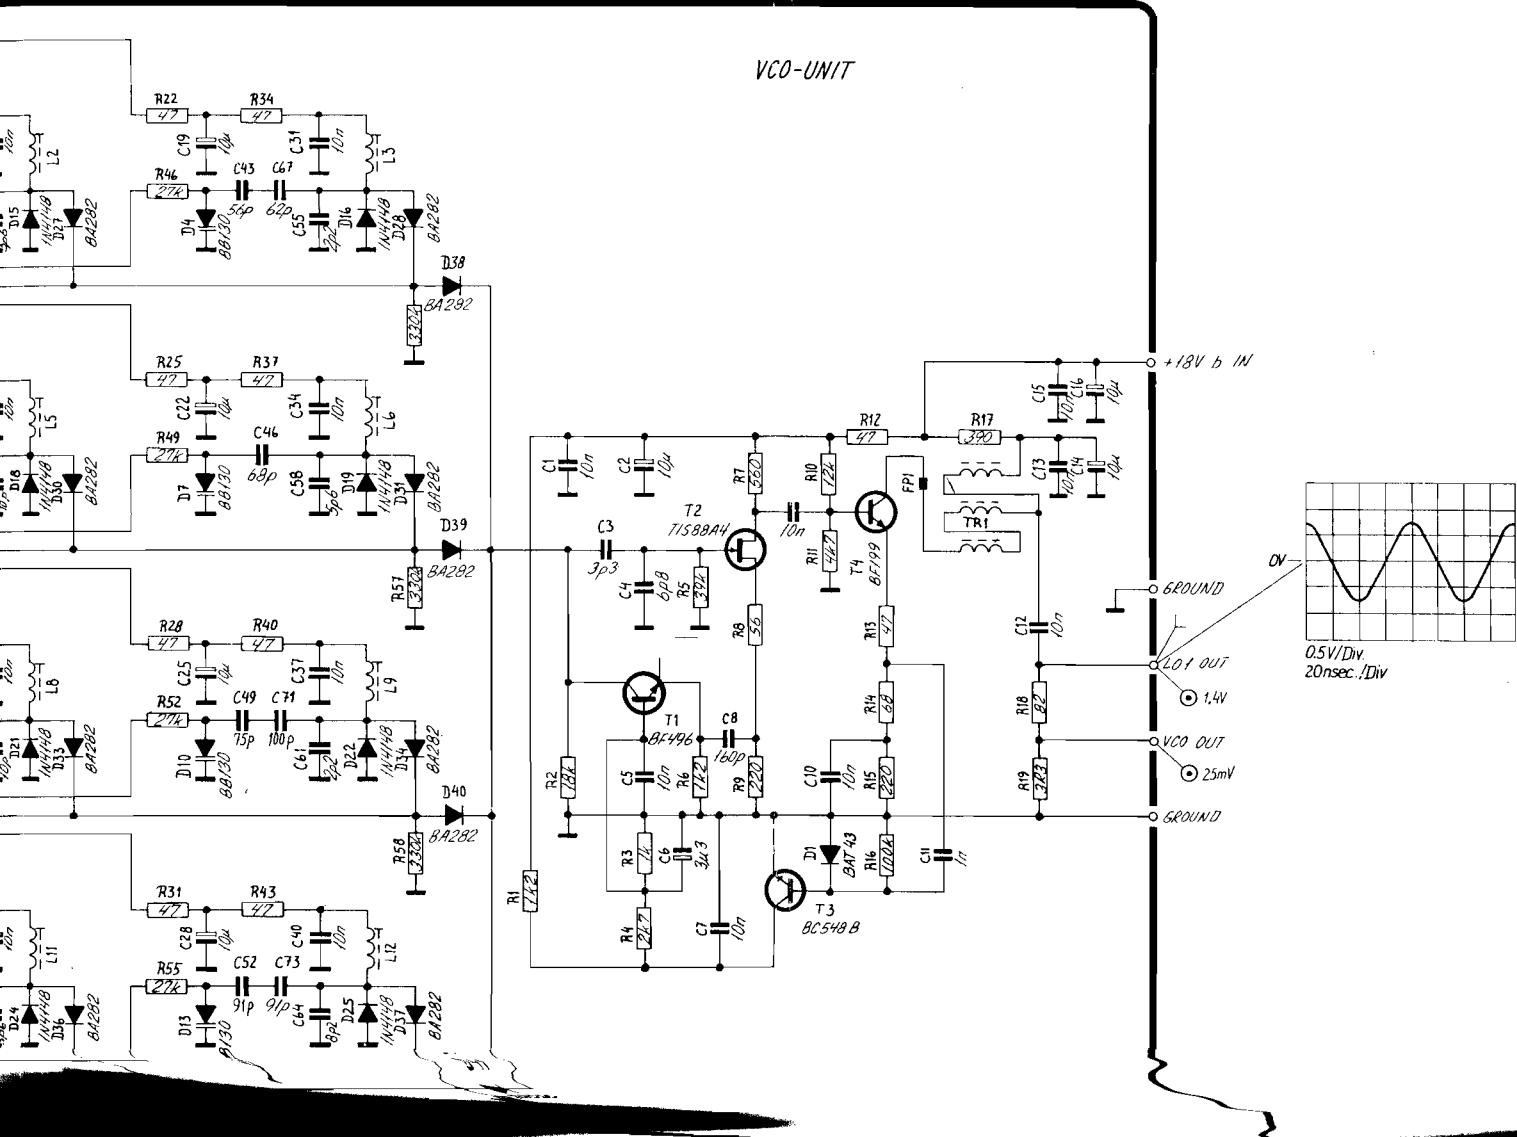

The frequency of oscillation can be varied by means of the VCO-control input via the appropriate variacap. diode D302 to D310. The appropriate coil L304 to L315 is adjusted to give the maximum output frequency in the selected 2 MHz band for a control voltage of $\pm 15V$. When the output frequency is varied 2.0 MHz for each coil section the control voltage will change about 6 to 9.5 Volts.

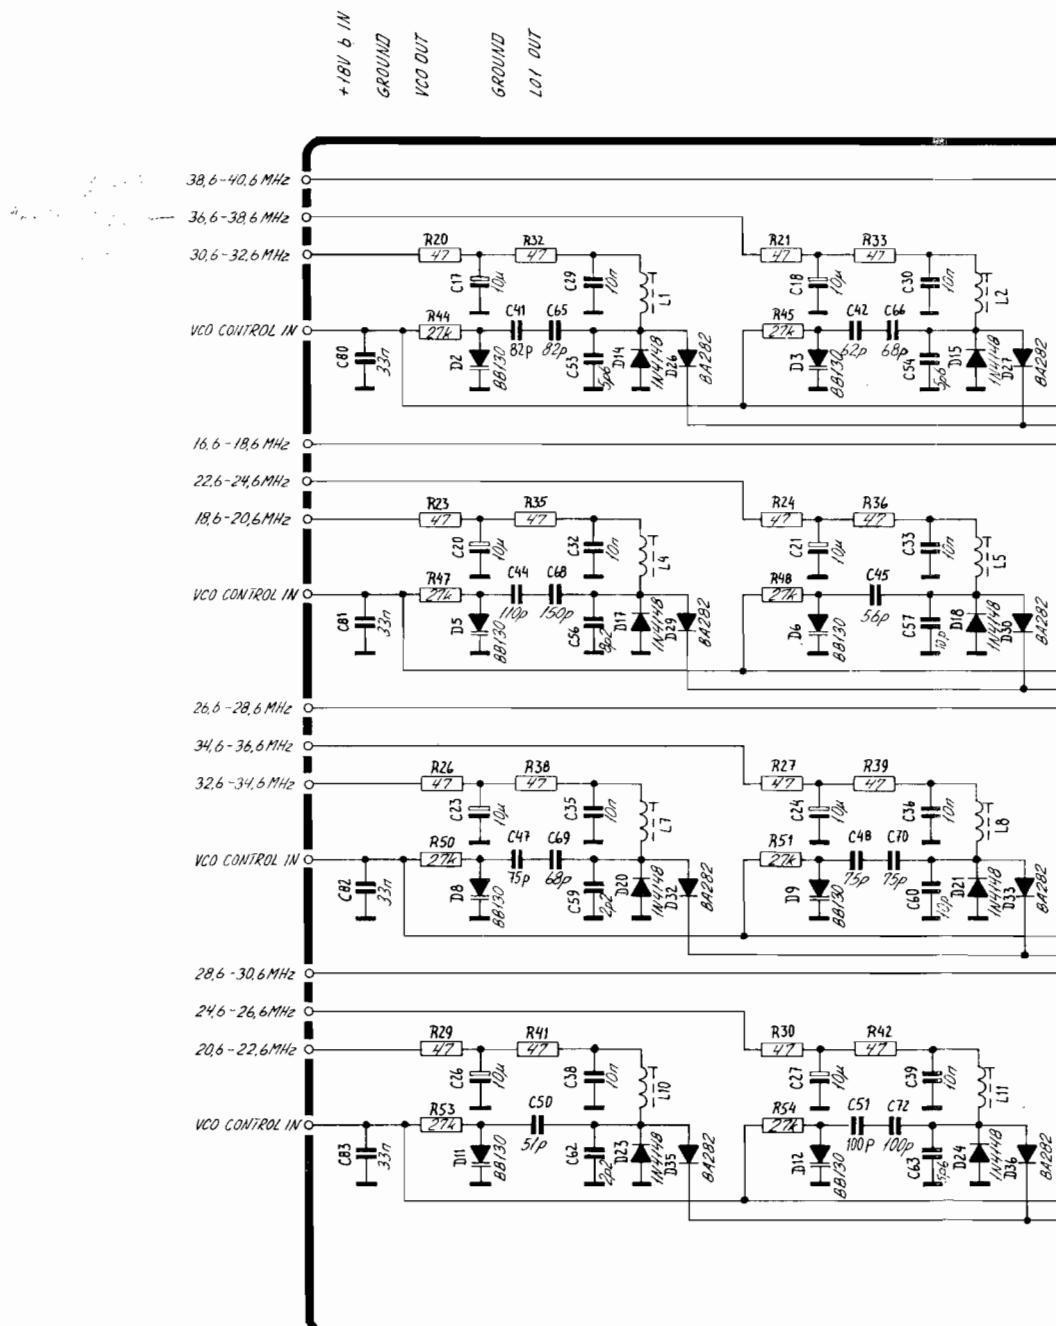

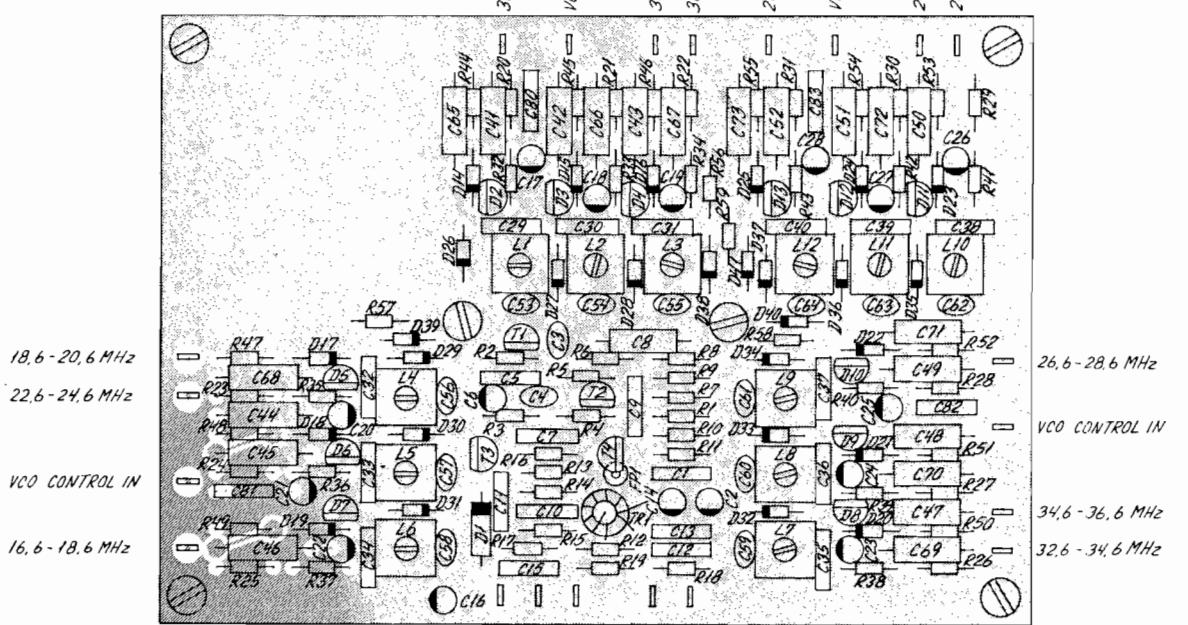

The AC amplitude level at the tuned circuit and also at the buffer output port is kept constant by means of an ALC-circuit. The output level is sensed at R314 by the level detector C311, R316, and D301. Via T303 and R301 the DC-current and so the gain in T301 are regulated to give a constant output amplitude from the buffer amplifier built around T304. The DC-level at the collector of T303 will be able to vary between about 4.5V and 10.5V over the entire frequency range. The output level will be about $1.4V_{pp}$ at C312 and about 50 mV_{pp} at the top of R319.

CIRCUIT DESCRIPTION HARMONIC FILTERS R1119 & R1120

This unit consists of twelve tuned LC-circuits which are switched in and out by the diodes D1313 - D1326 and an automatic gain controlled amplifier.

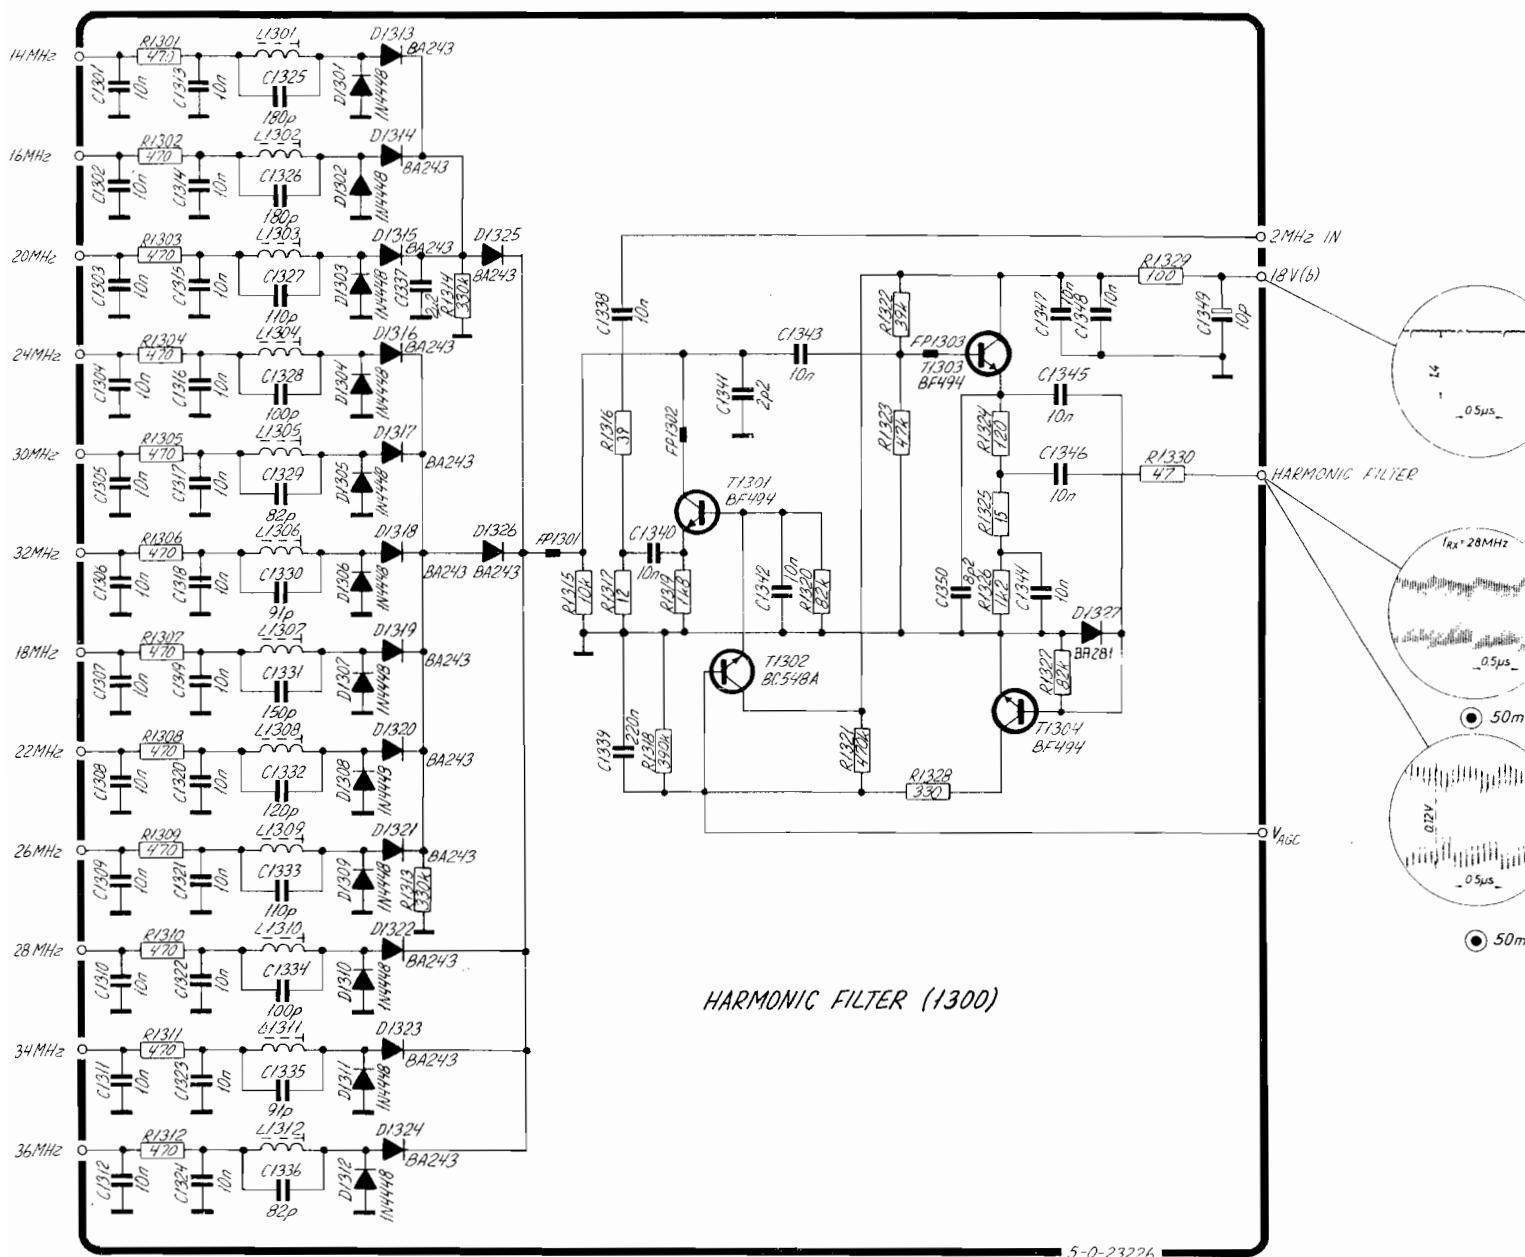

The circuit receives signal from the 2 MHz spectrum generator located on the divider board, and the selected LC-circuit together with T1301 filters out and amplifies the wanted harmonic of the input signal. The collector signal of T1301 is then fed to the emitter follower T1303.

The output voltage of the emitter follower is detected by D1327, T1304 and C1345. Through T1304, R1328, R1321, R1318, and C1339 the AGC-voltage is generated and via T1302 this voltage regulates the gain in T1301 to maintain constant output voltage of the filter.

HARMONIC FILTER (1300)

CIRCUIT DESCRIPTION HARMONIC FILTERS R1119 & R1120

This unit consists of twelve tuned LC-circuits which are switched in and out by the diodes D1313 - D1326 and an automatic gain controlled amplifier.

The circuit receives signal from the 2 MHz spectrum generator located on the divider board, and the selected LC-circuit together with T1301 filters out and amplifies the wanted harmonic of the input signal. The collector signal of T1301 is then fed to the emitter follower T1303.

The output voltage of the emitter follower is detected by D1327, T1304 and C1345. Through T1304, R1328, R1321, R1318, and C1339 the AGC-voltage is generated and via T1302 this voltage regulates the gain in T1301 to maintain constant output voltage of the filter.

CIRCUIT DESCRIPTION LOOP 1 MIXER S130X

This unit mixes together the VCO signal and the signal from the harmonic filter, and filters out the difference frequency to supply the variable divider.

The VCO signal is fed to the top of R501 which is part of a voltage divider. From here it is fed into a buffer amplifier T501 and after that to the integrated balanced mixer IC501. To this the harmonic filter signal is applied via C505. Output from the mixer is fed into the combiner transformer TR501 feeding into the low-pass filter containing L502 and L503. This low-pass filter filters out the wanted mixing product and prevents the two local-oscillator signals from reaching the variable divider. The filtered signal is amplified in the output amplifier T502.

CIRCUIT DESCRIPTION VCXO & LOOP 2 FILTER S130X

This unit contains the integrator and loop filter for loop 2, the voltage controlled crystal oscillator (VCXO) and the loop 2 mixer.

LOOP 2 FILTER

The integrator is built up around IC601 the integration capacitor is C605. R601 feeds current into the diode coupled Darlington pair in the phase comparator MC4044 on the divider board to make the 1.5V reference. Output from the integrator pin 6 on IC601 is fed into the low-pass filters R607, C607, R609 and C606 to filter out the 100 Hz ripple from the phase comparator. From the low-pass filter the control voltage is fed via R615 into the VCXO.

VCXO

The VCXO is built up around the FET T601. The oscillator is an ordinary Hartley oscillator with a crystal in the feed-back path. The crystal is tuned with the varicaps D601 and D602 to carry out the voltage control of the frequency. The output from the VCXO to first mixer is taken from the tap on the coil L601. From the source a portion of the oscillator signal is taken to the loop 2 mixer.

LOOP 2 MIXER

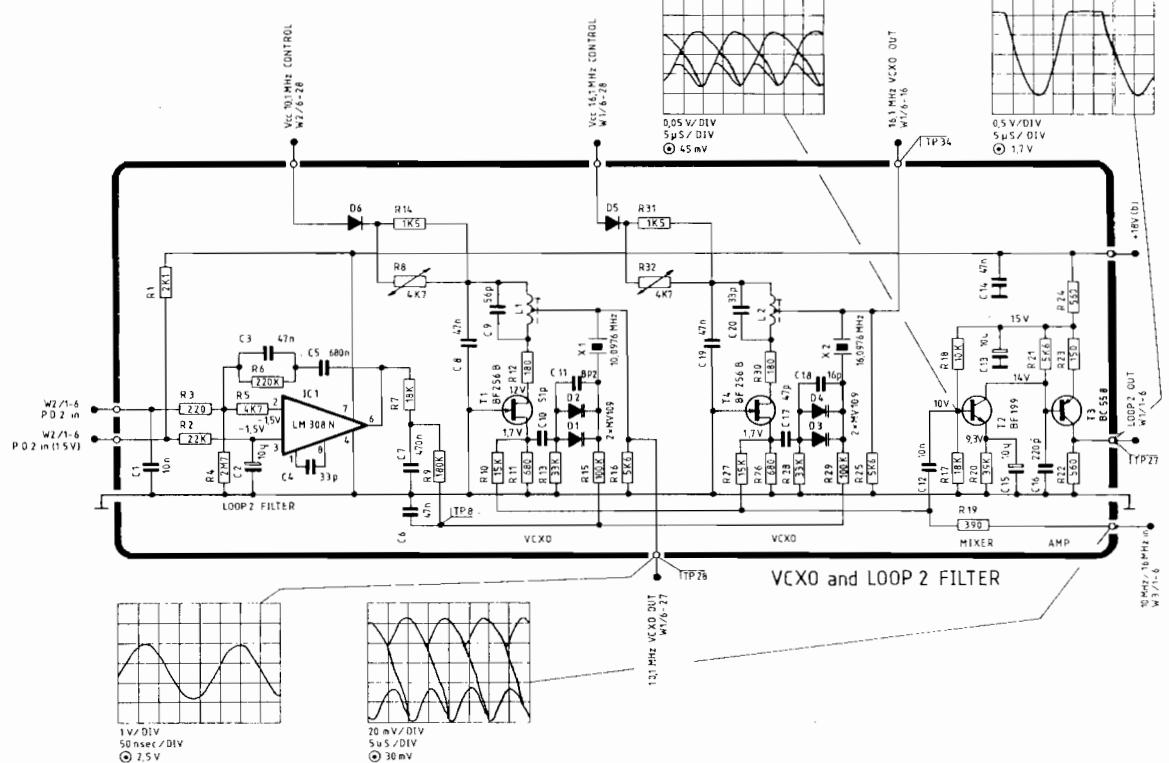

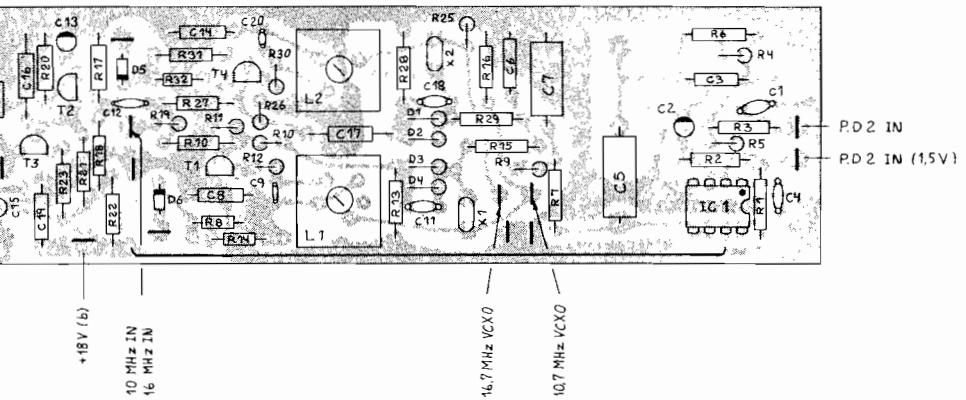

As mentioned above the VCXO signal is fed into the base of mixer transistor T602 via R610. 10 MHz from the TCXO are applied to the same base via R619. Because of the big difference between the two oscillator frequencies and the wanted output frequency the only filtering needed to filter out the wanted frequency product is R621 and C616. The mixer transistor feeds into the output amplifier T603.

MODULE 600
VCXO & LOOP 2 FILTER

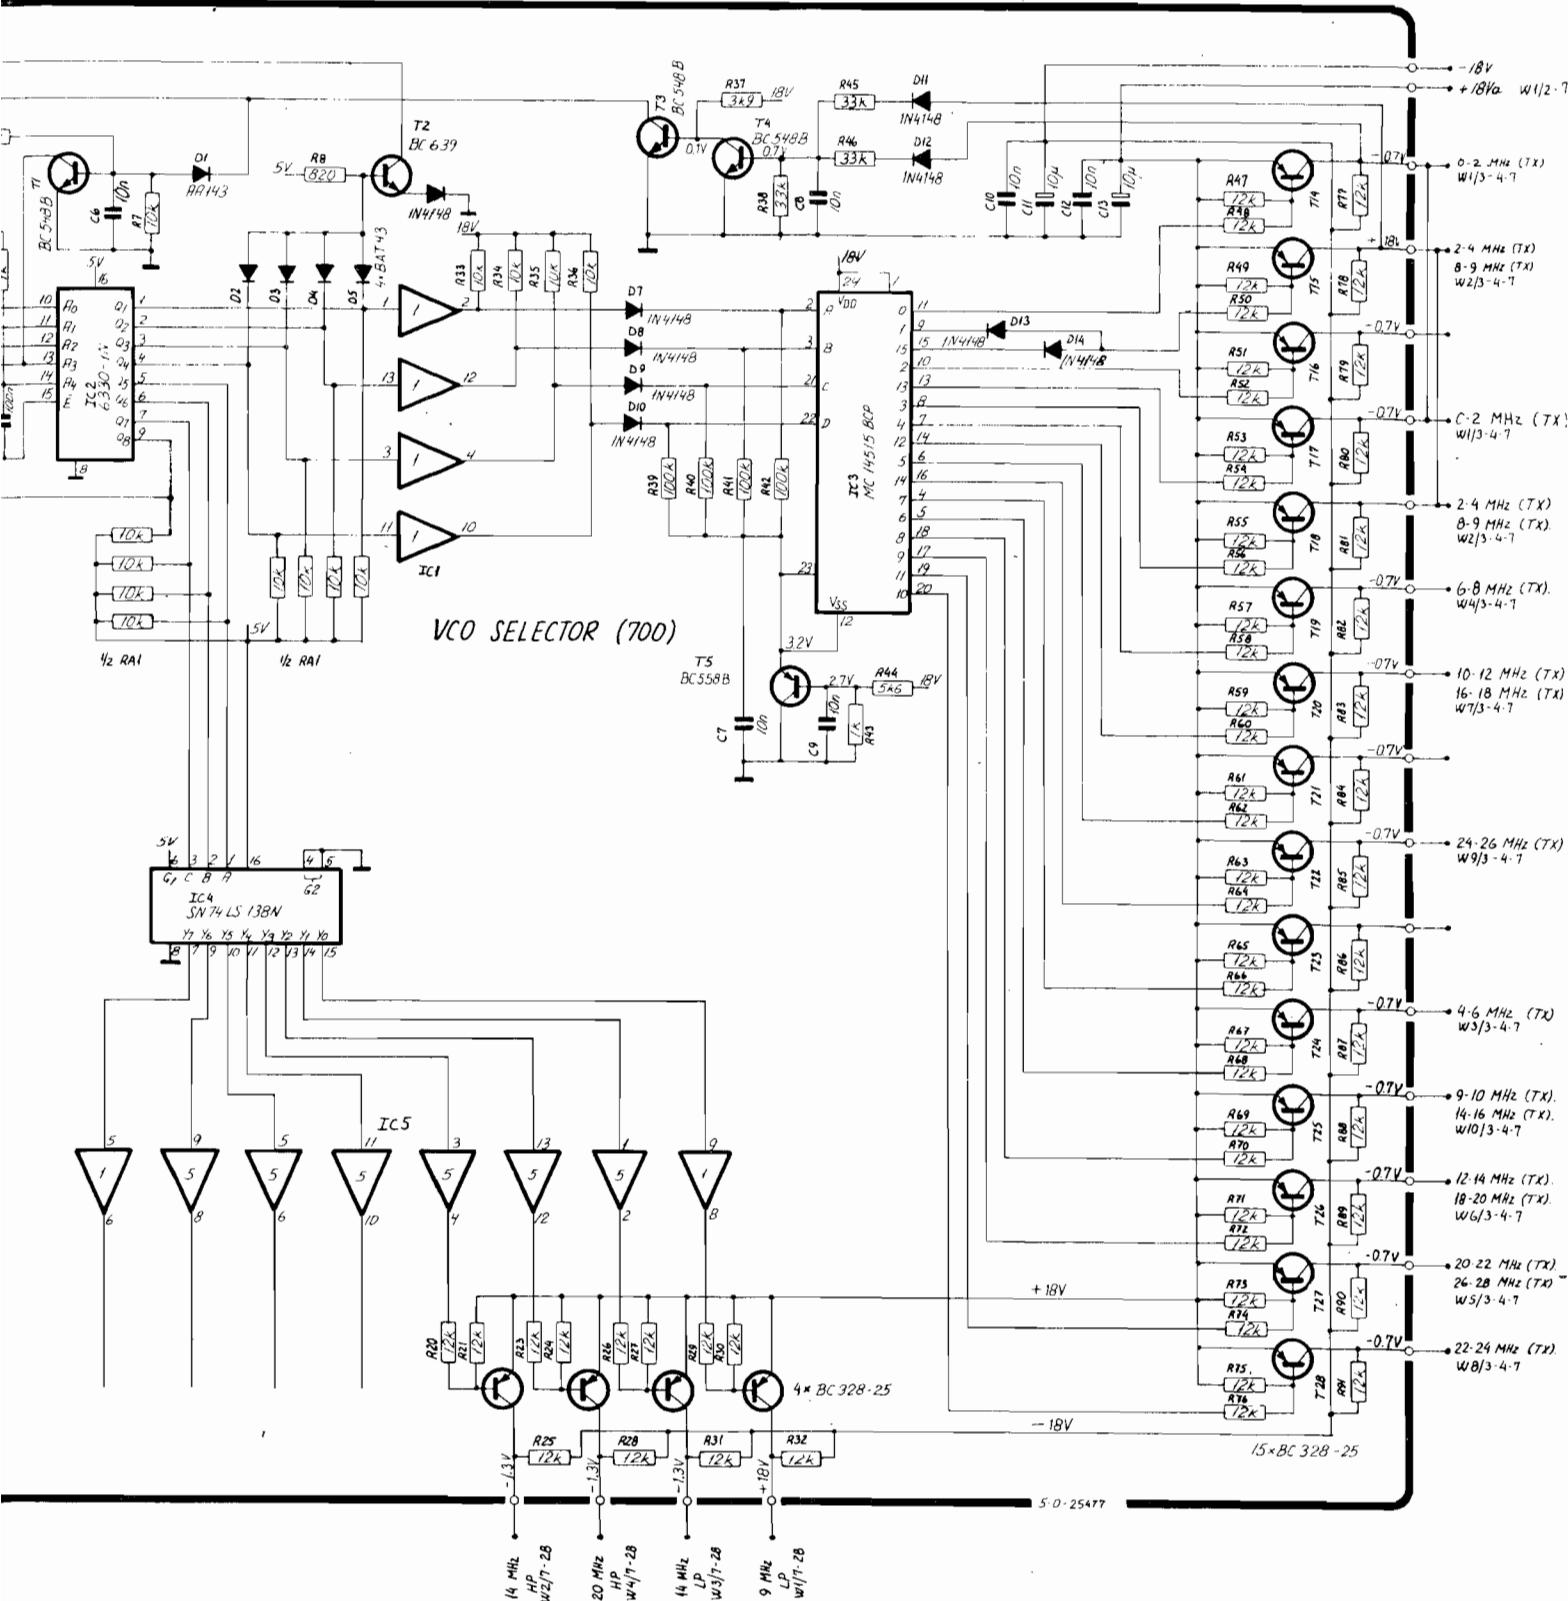

CIRCUIT DESCRIPTION VCO SELECTOR S130X

This unit has a five bit code input (T,V,X,Y,Z) and according to this information it will select the proper VCO and band filter. The five bit code addresses a prom IC702 which contains the code for VCO, band filter, and 1 MHzA information corresponding to every band. IC704 is a 3 to 8 line decoder which controlled from the prom IC702 turns one of the outputs low. This output selects via a buffer and a driver transistor the band filter in question.

The VCO code is from the prom IC702 fed to a 4 to 16 line decoder via a level shifter formed by IC701, R33-36, D707-D710, R739-R742 and T705 with surrounding components. Controlled by the code of the inputs ABCD IC703 turns low an output and via a driver transistor selects a VCO.

T703 and T704 detect whether the frequency is below 4 MHz or not. T702 and the diodes D702-D705 indicate when the band code for 2182 kHz fixed is at the inputs T,V,X,Y,Z.

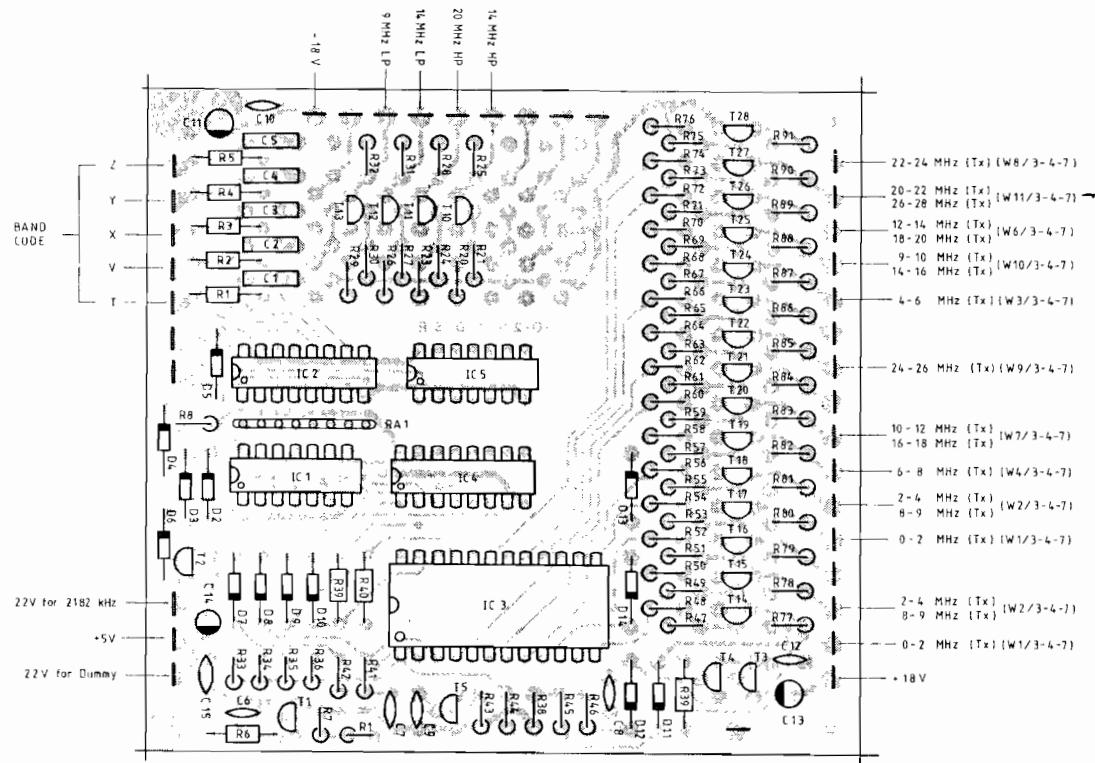

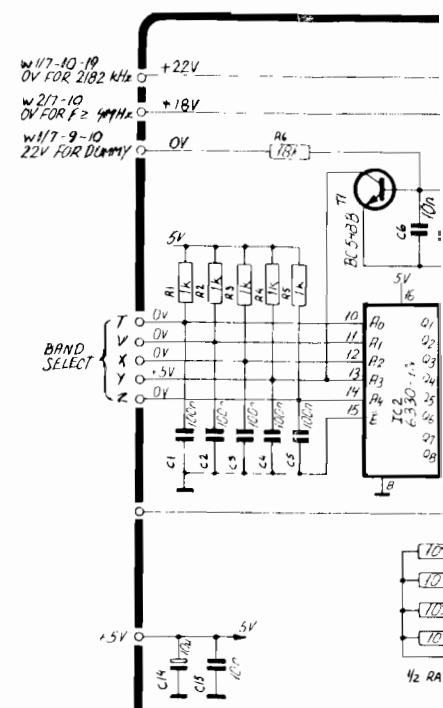

T701 turns low the Y bit in the five bit code if dummy load is selected below 4 MHz. This results in a blocking of the band 2.0 - 2.199 MHz as it has the band code (TVXYZ) 00010. The band code is turned in the code 00000 and if the operator tries to transmit into the dummy-load in the frequency band 2.0 - 2.199 MHz, the PA stage will prevent transmission because it will not accept the code 00000.

CIRCUIT DESCRIPTION SSB GENERATOR S130X

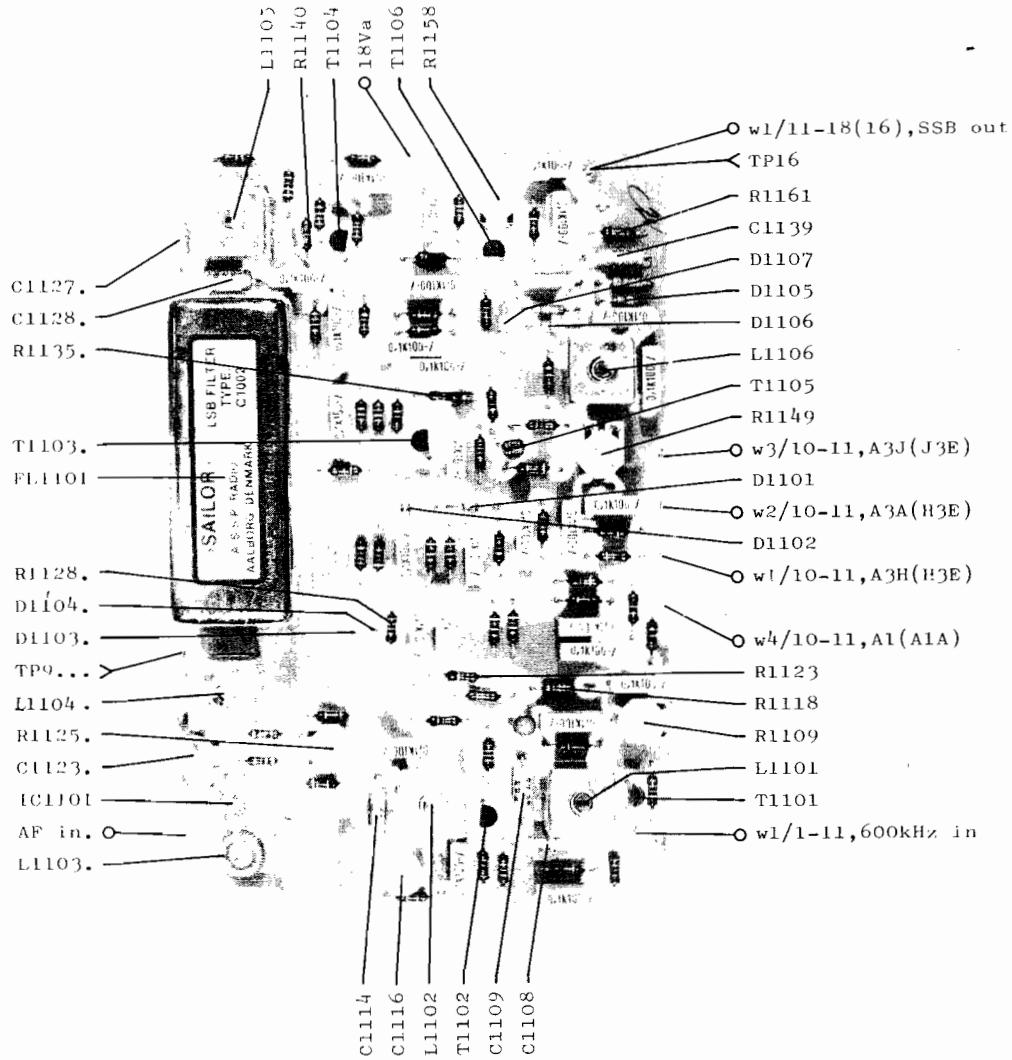

In this unit the required types of signals are generated A3A (R3E), A3H (H3E), A3J (J3E) and A1 (A1A).

SSB GENERATOR

The 600 kHz carrier signal from the divider unit is fed to the tuned amplifiers T1101 and T1102. From the collector of T1101 the 600 kHz signal is fed to the carrier reinsertion circuit. From the collector of T1102 the carrier signal is fed to the double balanced modulator IC1101, which also receives the AF signal from the microphone amplifier. The output from IC1101 is a double sideband signal, which is fed through the single sideband crystal filter for removing of the carrier and the upper sideband. The resulting lower sideband signal is fed through the impedance matching coil L1105 to the basis of transistor T1104, where the lower sideband signal and the wanted carrier voltage is added. The signal is now fed through the output amplifier consisting of T1105 and T1106 to the SSB output terminal. The amplifier T1105 and T1106 are working as a signal limit amplifier, where the maximum output voltage is controlled of the zener diode D1107 and the diodes D1106, D1105.

CARRIER INSERTION

The 600 kHz carrier signal from the collector of T1101 is fed to the voltage divider R1109, R1118, R1123, R1128 and R1130. The wanted carrier level is controlled by a DC voltage fed to one of the diodes D1101, D1102, D1103 and D1104.

CIRCUIT DESCRIPTION MICROPHONE AMPLIFIER S130X

This unit generates and processes all the AF signals used in normal operation.

COMPRESSOR

The AF signal is after level regulation in R1201 fed into a voltage divider R1204, R1205 and then the FET T1202 acts as an electronically variable attenuator. The amount of attenuation is controlled by the voltage applied to the gate of the FET T1202.

The FET T1202 is biased in the off condition by 5.1V from zenerdiode D1202, with no control voltage applied to the gate. Under these conditions no attenuation takes place. With a control voltage of 5.1V applied to the gate, max. attenuation is obtained.

The electronically controlled attenuator is used to keep the output across the FET T1202 constant independent of speech volume, so performing a compressor action.

The control voltage already mentioned is derived from the very same signal, across the FET T1202 after amplification by T1203 and T1205. The output is taken across R1219 and fed to the level detector system consisting of T1210 and D1205.

As soon as the applied voltage to the base of T1210 becomes sufficiently low (about 4.7V) the collector current in transistor T1210 cuts off. This means that transistor T1208 normally saturated by the collector current of T1210 cuts off, leading to saturation of T1207 with the result that capacitor C1214 is charged very quickly.

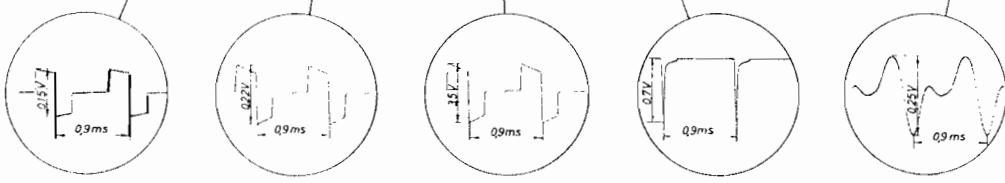

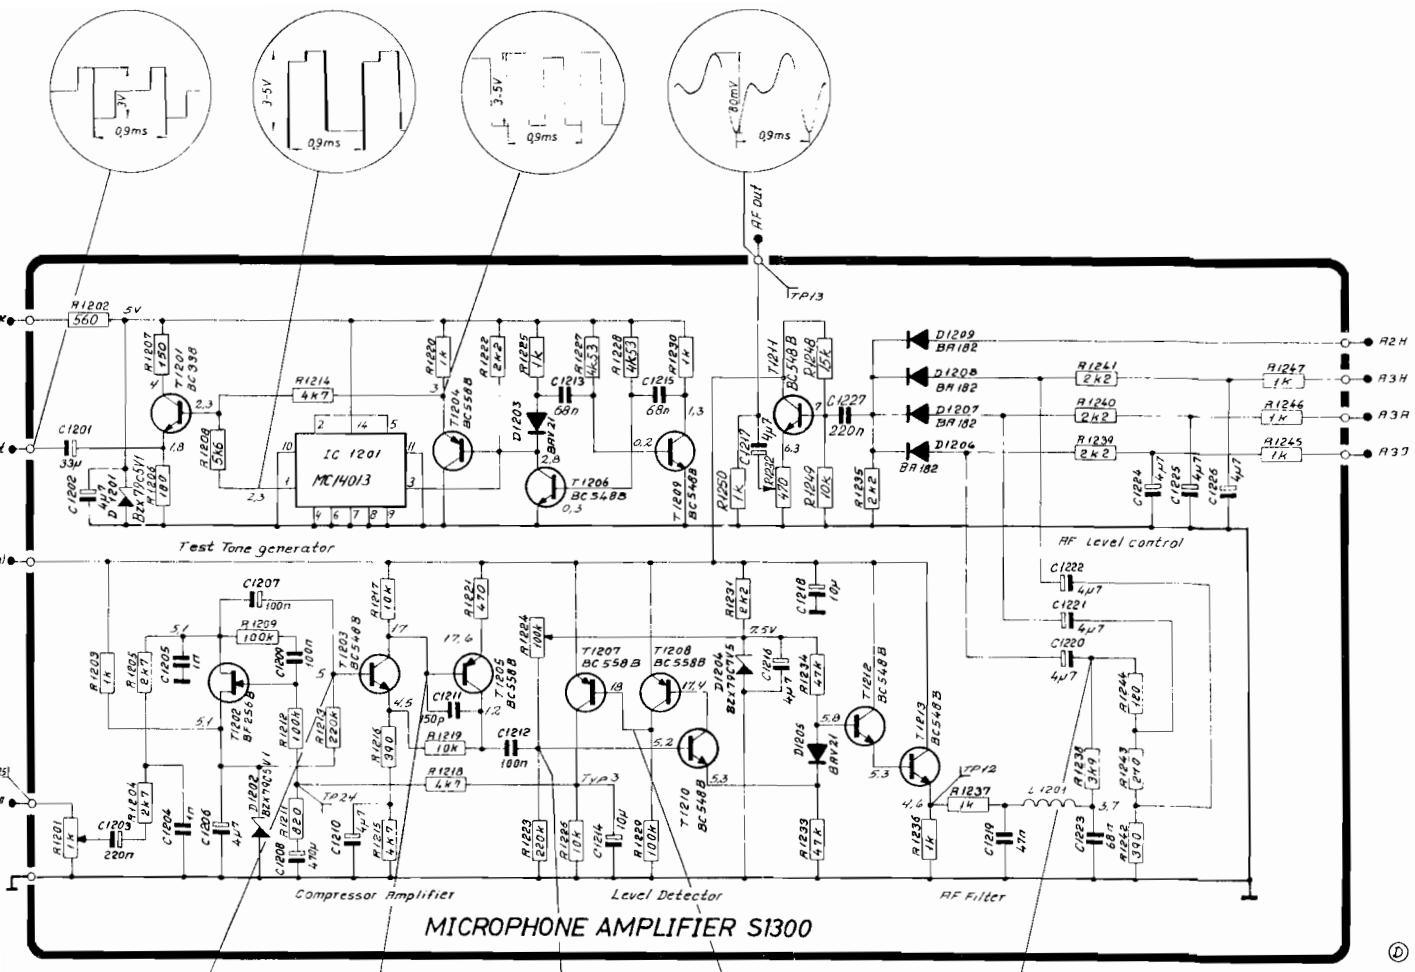

The voltage across C1214 is slowly discharged via R1218 and the filter circuit R1211 and C1208 and is applied to the gate of the previously mentioned FET T1202 via R1212.

Presence of the control voltage causes the attenuation to increase until the collector current in transistor T1210 is not cut off any more, and a balanced condition is established. The amplified and compressed microphone signal then passes through to an AF filter driven by T1212 and T1213 removing signals insignificant for clarity. The AF signal from the filter is carried to the fixed voltage divider R1238, R1244, R1243 and R1242. The AF voltages from this voltage divider is chosen with the diode D1206, D1207, D1208 or D1209 feeding into the output amplifier.

TEST TONE GENERATOR

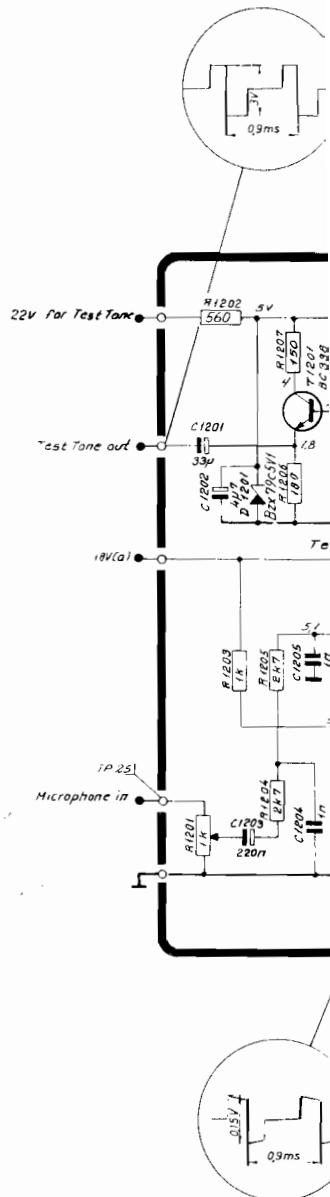

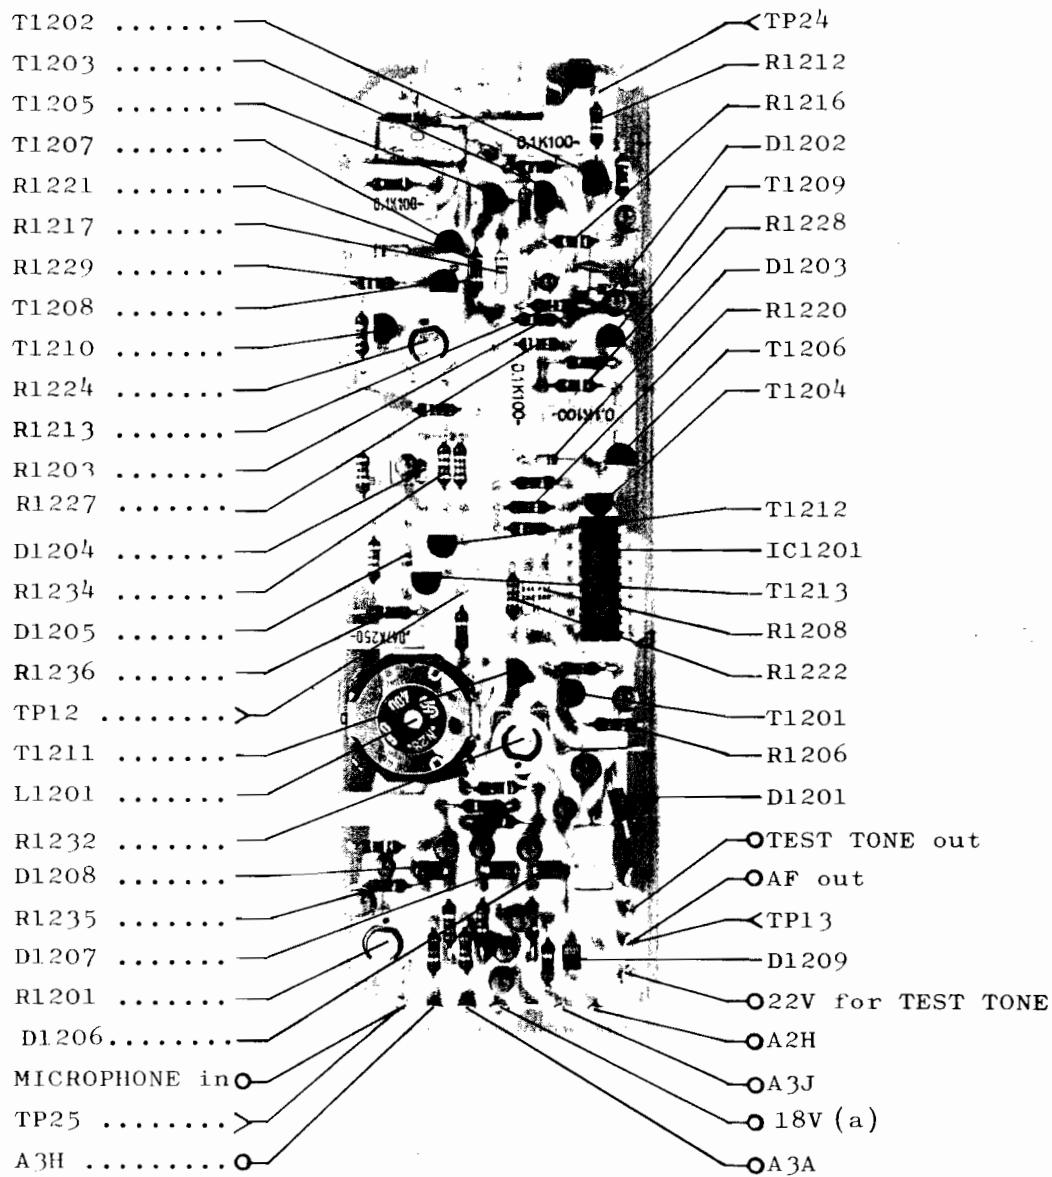

The test tone generator is a two-tone generator operating at the frequencies 2400 Hz and 1200 Hz. The multivibrator, composed of T1206, T1209 is oscillating at 2400 Hz, and in the integrated circuit IC1201 this frequency is divided to 1200 Hz, which can be measured on pin 8.

T1204 functions as emitter follower, and the 2400 Hz signal is fed from here via R1214 to the output transistor T1201. The 1200 Hz signal is also fed to T1201 via R1208 and is mixed with the 2400 Hz signal. The mixed signal is supplied to the compressor input during tuning of the transmitter and owing to the presence of the AF filter. Sinewave shaped tones are produced, as the two-tone generator itself delivers square wave voltages.

TEST CONDITIONS

CIRCUIT DESCRIPTION ALARM SIGNAL GENERATOR S130X

The alarm signal generator creates the alarm signal which consists of 2200 Hz and 1300 Hz - tones, which are transmitted in 45 secs alternately with intervals of 250 msecs. Additional it is possible to strap the generator to repeat the alarm signal transmission after a 2 minutes pause.

The alarm tones are generated by dividing down the 10 MHz TCXO signal to the wanted frequencies. The generator starts when the 22V supply is applied. T1303 and T1304 amplify the 10 MHz signal to TTL level. IC1313 is a 16 divider and its output on 625 kHz is fed to the programmable divider consisting of IC1307, IC1312, IC1302b, IC1302d, IC1303a and IC1311. Pin 9 of IC1312a goes high when IC1307 has received 141 clock pulses. If pin 12 of IC1302d is high (2200 Hz) the J input of IC1311a follows the output of IC1312a and then the FF 1311a will toggle on the next clock pulse. This clears the counter IC1307, now J and K input of IC1311a is "0" and "1" which will let it toggle on the next clock pulse and then the counter IC1307 will start counting again.

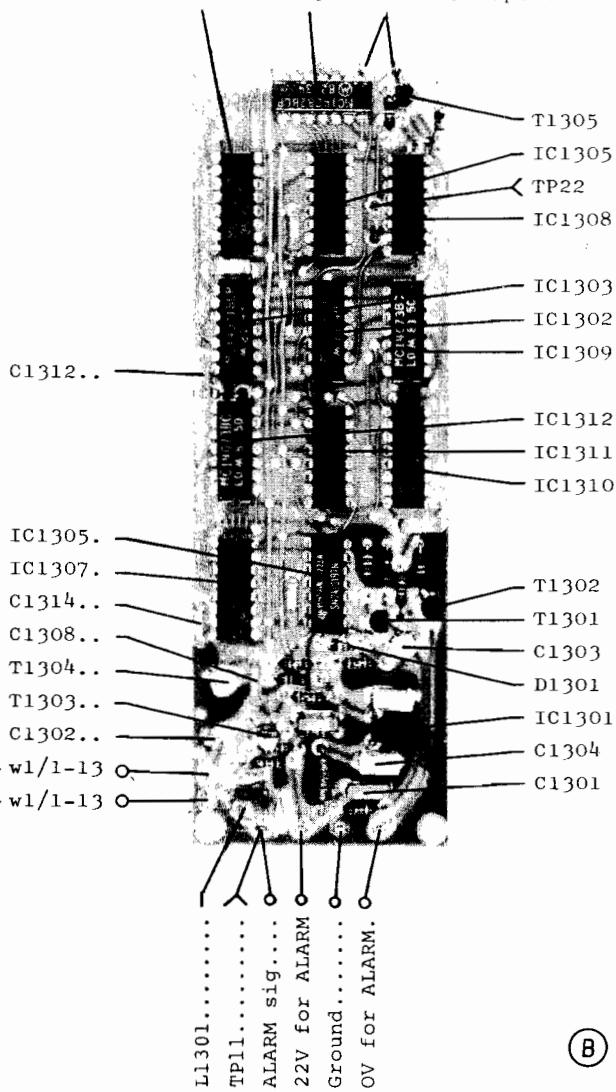

The timing is shown on fig. 1. After a division by two in IC1311b the output at pin 15 will be 2200 Hz which occurs like this $625000/(141+1)^2 = 2200$.

When the wanted frequency is 1300 Hz, pin 12 on IC1302d must be "0" and then the J input on IC1311a will not be "1" before the output of IC1312a and IC1312b both are "1". When this happens the amount of clock pulses to IC1307 is $141 + 98 = 239$ (141 detected by IC1312a and 98 detected by IC1312b). The dividing figure from clock input of IC1307 to Q output of IC1311b is $(141 + 98 + 1)^2$ and the resulting frequency is $625000/(141 + 98 + 1)^2 = 1302$ Hz. With a mode of operation similar to the before mentioned divider, which generates the 2200 Hz and the 1302 Hz tones, a circuit formed by IC1310, IC1309, IC1302a, IC1303b and IC1308 dividers. These tones down to 2 Hz which means that the output of IC1308b changes state every 250 msecs. The dividing figures detected at the output of IC1309b and IC1309c are 549 and 324 respectively.

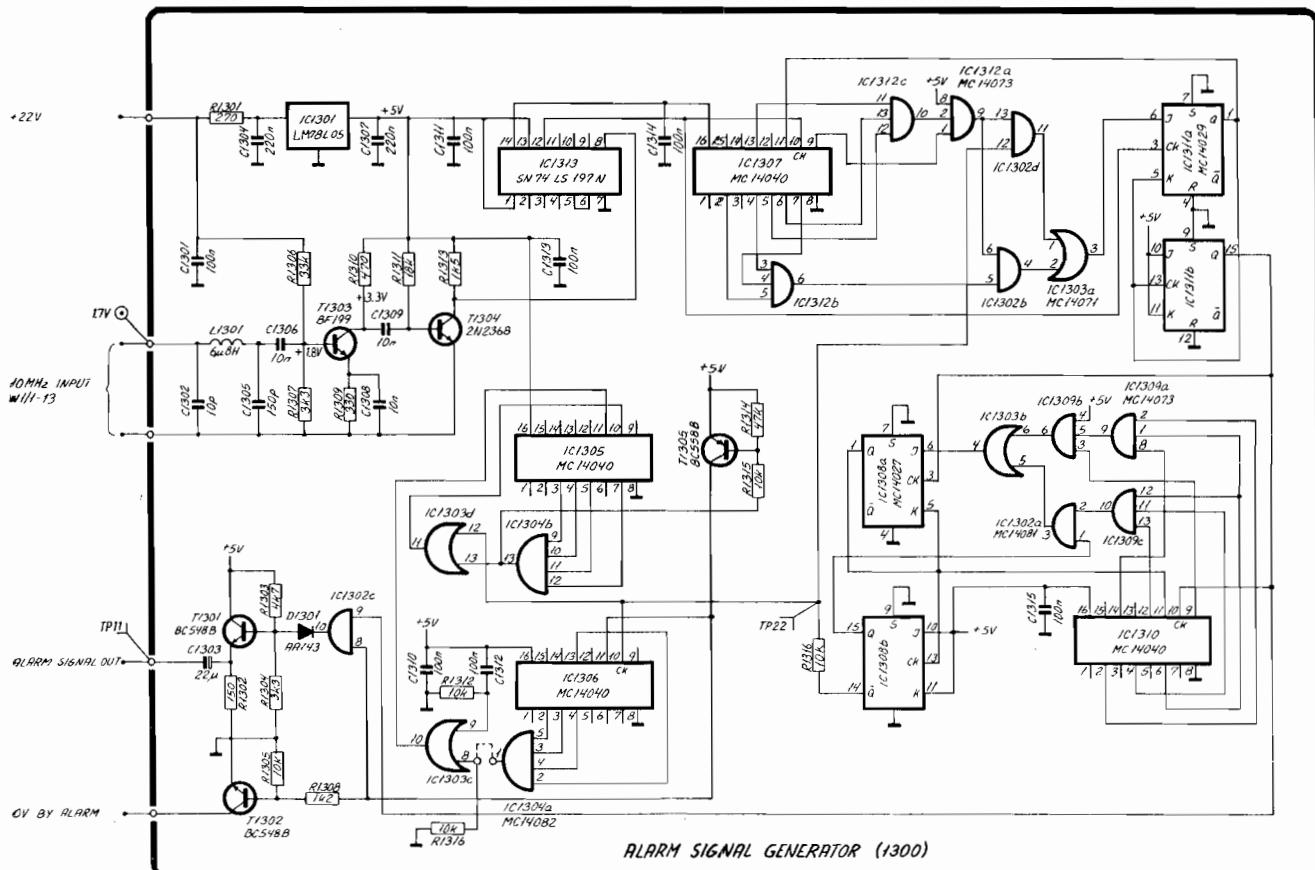

This dividing circuit controls both its own dividing figure (IC1308b pin 15) and the dividing figure (IC1308b pin 14) in the circuit which makes the 2200 and 1302 Hz tones. The timing is shown in fig. 1.

When the alarm generator starts by power-up, IC1305 is reset via IC1303c. This turns on T1305 which gates the alarm signal to the ALARM SIGNAL OUT connection. IC1305 counts the 2 Hz pulses from IC1308b and when an amount of 90 is reached (after 45 secs) the output of IC1304b is "1" which stops the clock pulses to IC1305 and turns off T1305 which blocks the gate IC1302C and hereby stops the alarm signal transmission. However the 2 Hz pulses at IC1308b are still running as long as the unit is powered up. When alarm transmission is stopped by T1305, IC1306 is not reset any longer and it will start counting the 2 Hz pulses. After 240 pulses (2 minutes) pin 1 of IC1304a is "1" and if the strap to pin 8 of IC1303c is on, IC1305 will be reset and the alarm signal transmission starts for another 45 secs. If the mentioned strap is present the alarm signal transmission will be repeated for every 2 3/4 minutes, otherwise it is only transmitted for one 45 secs. period.

IC1306 IC1304 2 min. repeat

CIRCUIT DESCRIPTION OUTPUT FILTER S1302/03/04

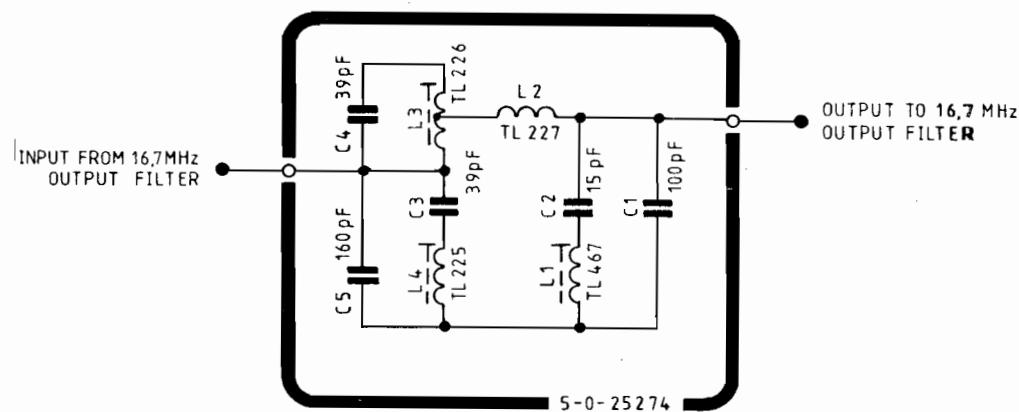

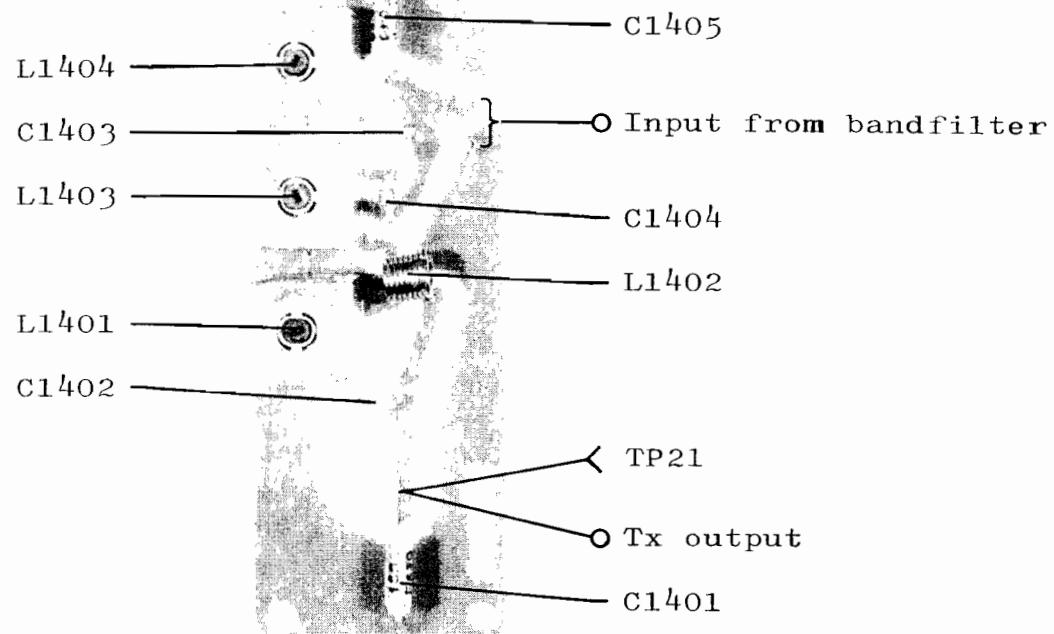

This unit contains a combined band stop and low-pass filter.

The band stop filter has a 1 dB bandwidth of approx. 1.7 MHz and the center frequency is 10.7 MHz.

The low-pass filter has a 3 dB frequency of approx. 33.3 MHz.

The band stop frequency is adjusted with L1401, L1403, and L1404.

The low-pass frequency is adjusted with L1402.

OUTPUT FILTER

CIRCUIT DESCRIPTION BAND FILTER S1302/03/04

This unit contains two amplifiers, four band-pass filters, and two low-pass filters.

The signal from the third mixer appears at the base of the first amplifier T1501 via C1501. This amplifier is supplied with feed-back via R1501 and R1505 to act as the correct load for the mixer. The output from this amplifier is via an 1:2 transformer TR1501 fed to the selected band-pass filter or low-pass filter.

The proper filter is selected with DC voltages from the VCO selector unit. When the 0-6.4 MHz LP filter is selected, the supplied DC control voltage is biasing the diodes D1501, D1505, and D1507 in the forward direction and the diode D1503 in the reverse direction.

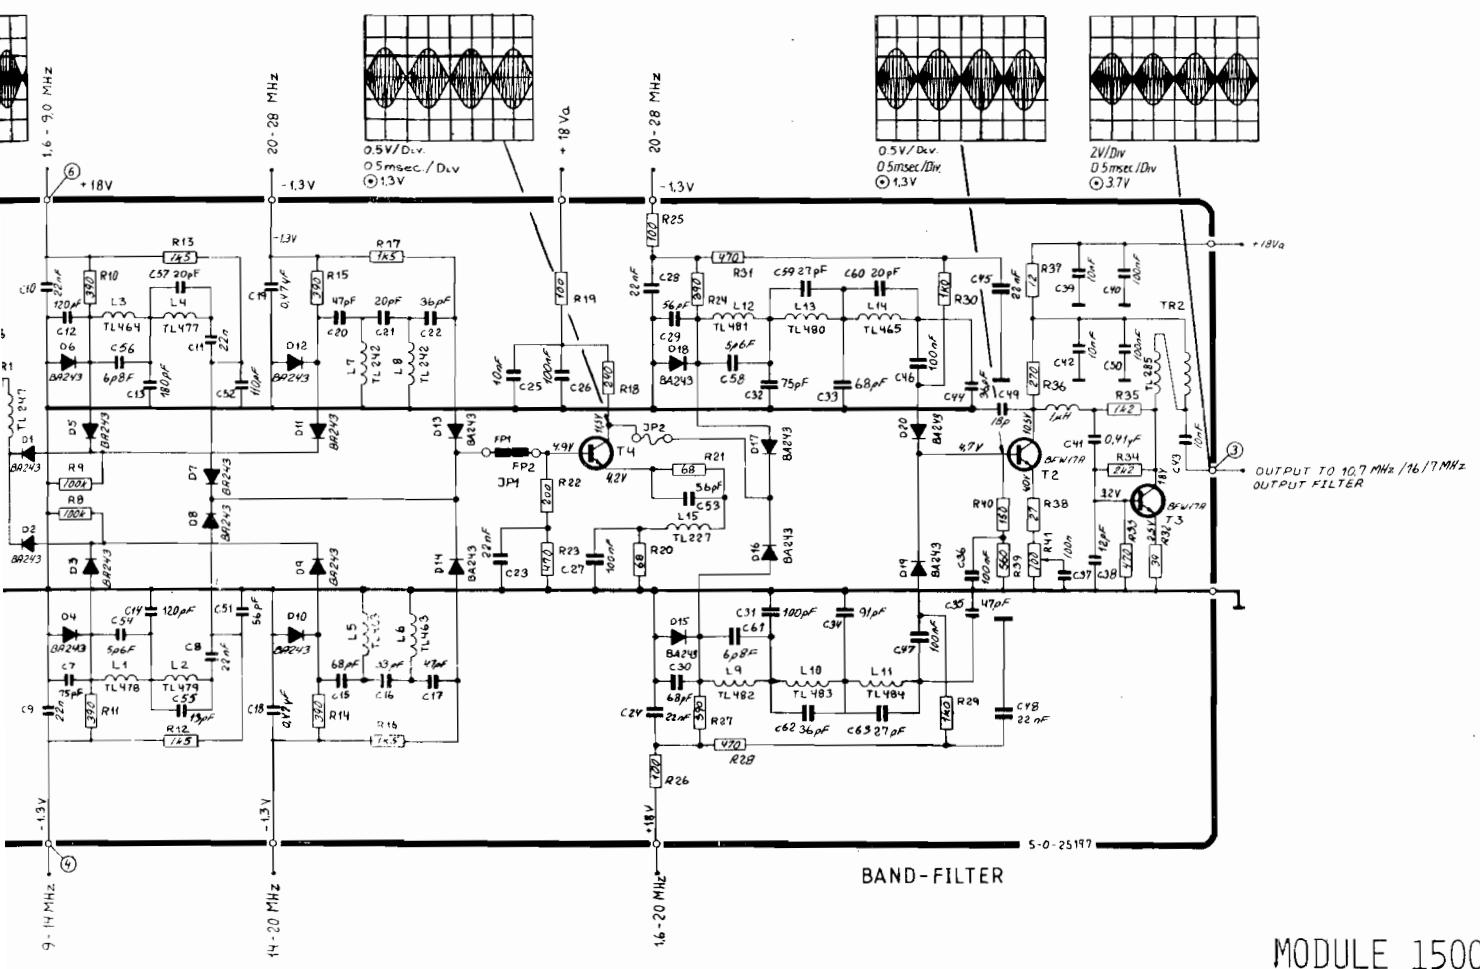

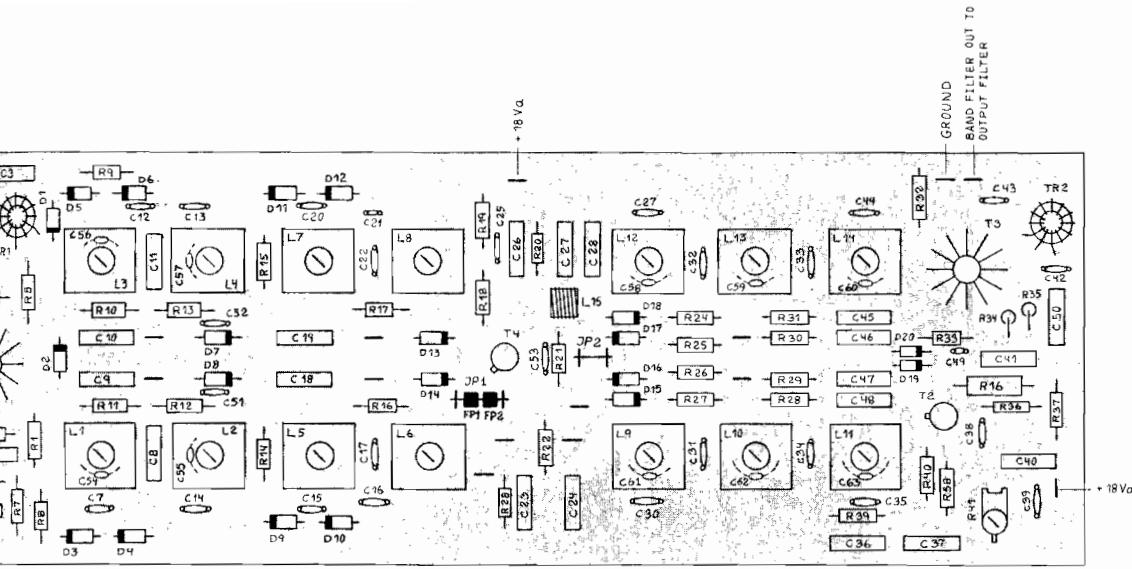

The output from the chosen filter is fed to the buffer transistor T1502 and via a frequency compensating network, consisting of L1513 and C1549, through the transistor T1503 to the output terminals.

CIRCUIT DESCRIPTION MIXER UNIT S130X

In this unit the 600 kHz signal from the SSB generator is mixed together with the VCXO and VCO signals in two steps to produce the wanted output frequency. In addition the necessary power level regulation is controlled in this unit.

FIRST MIXER

The transistors T1602 and T1603 form a balanced mixer. The 600 kHz signal is fed into the mixer via the phase splitting transformer TR1601. The VCXO signal is fed into the emitters via the buffer amplifier T1601. In this transistor it is possible to regulate the DC working point in two ways. One: changing the emitter resistor at the point "fixed power regulation". Two: changing the base current via a potentiometer between the two points "drive level potmeter". This DC working point regulation will control the amplitude of the VCXO signal to the mixer and in that way the output power is regulated.

FILTER AND AMPLIFIER

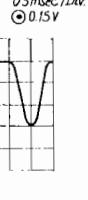

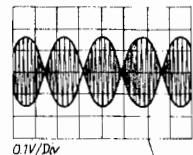

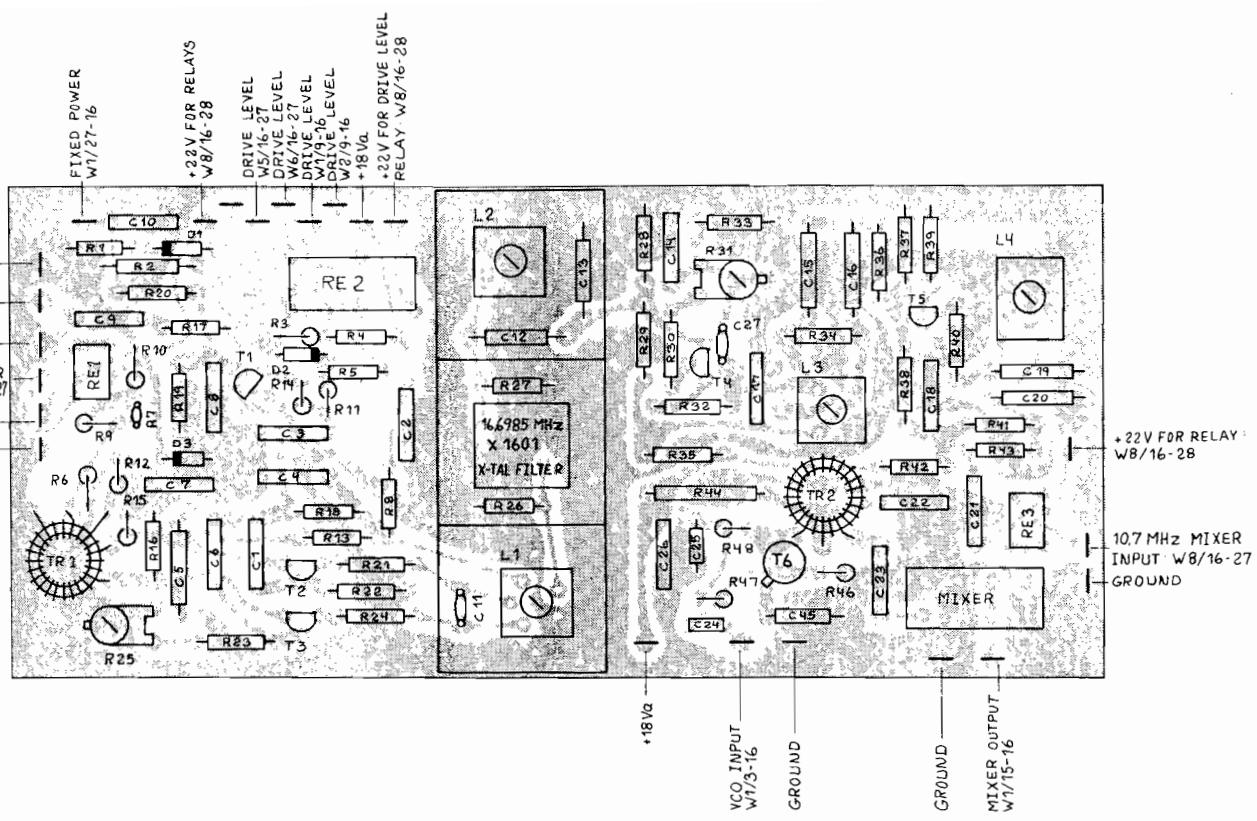

The first mixer feeds into the crystal filter FL1601. The tuned circuits containing L1601 and L1602 around the filter carry out proper impedance-matching to the filter. T1604 and T1605 are two buffer amplifiers, the circuit C1622, L1604, C1623 and R1643 carries out correct generator impedance for the mixer M1601.

SECOND MIXER

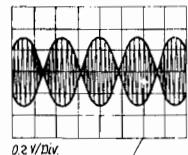

The second mixer M1601 is a double balanced hotcarrier diode mixer which mixes the 10.7 MHz signal together with the chosen VCO signal. The transistor T1606 is a wideband power amplifier supplying the mixer with the necessary power for proper operation. Output from the mixer is fed into the band filter unit.

TEST CONDITIONS

Frequency selector : 1A ($f = 2.0005$ MHz)
Power level : FULL
Mode : TUNE
Maximum drive, 50 ohm connected to TX out, J1702
Oscilloscope input : Passive probe 10 Mohm/11 pF
DC voltmeter input : 10 Mohm
◎ : Diode probe measurements
TP : Testpoints

A2H-OSC. AND DELAY-UNIT

CIRCUIT DESCRIPTION A2H OSCILLATOR AND DELAY UNIT S130X

This unit generates the necessary AF signal to modulate the exciter in the A2H mode and the necessary time delays for the telegraphy and telex operation.

A2H OSCILLATOR

The A2H AF oscillator is built-up around T1801 with the tuned circuit C1803, C1804 and L1801 adjustable to the wanted frequency 465 Hz.

The output is a combination of a DC voltage to switch on the diode in the microphone amplifier, and the AF signal which is controlled via potentiometer R1806.

TX-DELAY

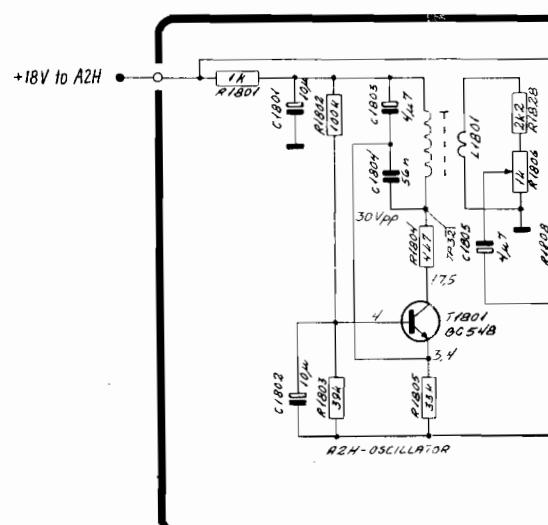

+22V FROM KEY controls T1805 to conduct, and T1805 will then supply +22V FROM TX-DELAY to the relays 600 kHz LSB ON/OFF and TX ON/OFF in telegraphy mode. When the key is released T1804 is off, but T1803 goes on for a time period of approx. 10 mS determinated by the monostable multivibrator T1802 and T1803.

RX-DELAY

With the transmitter keyed there is +18V ON +18V TRIG. keeping T1809 conducting, and in this way the receiver is blocked. When the key is released T1808 is off, but T1807 goes on and stays on for a time period between 8 mS and 30 mS determinated by the monostable multivibrator T1806 and T1807 and adjustable with R1819.

600 kHz LSB ON/OFF

The relay RE1801 switches the signal from the SSB generator to the mixer unit off in receive mode.

CIRCUIT DESCRIPTION POWER SWITCH S1303/04

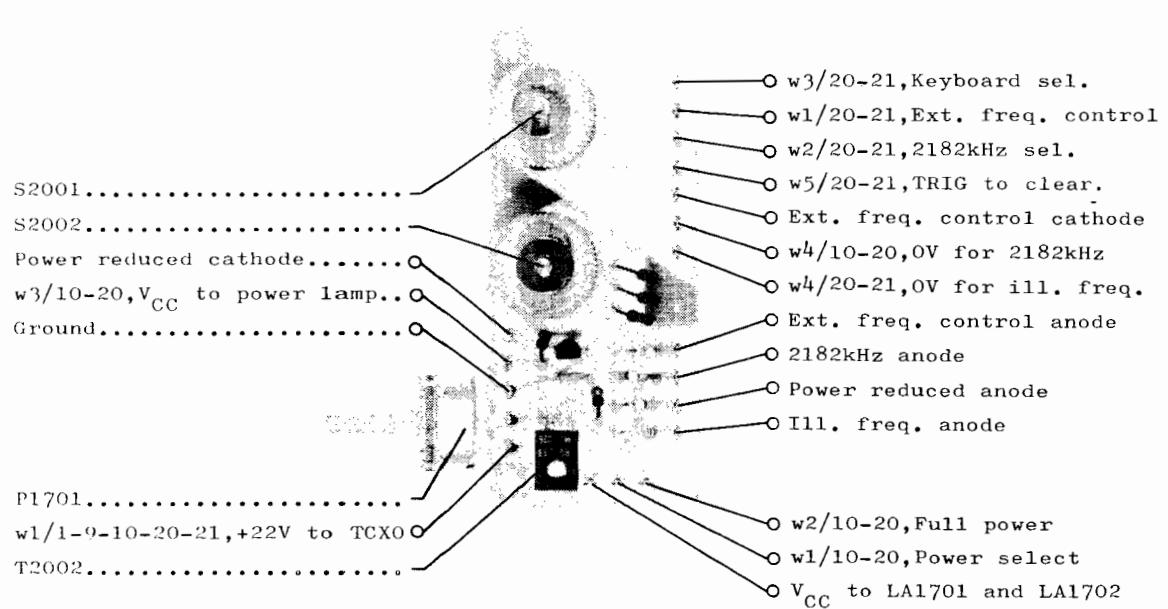

Transistor T2001 controls the power reduction led, which is alight as soon as the switch S2002 is activated to reduce the power. The Vcc to power lamp information is controlled by the tune information and is 0.0 Volt when tuning.

The transistor T2002 is connected to the dimmer potentiometer and the emitter is connected to the light emitting diodes, EXTERNAL FRQ. CONTROL, the 2182 kHz selected, and the POWER REDUCED.

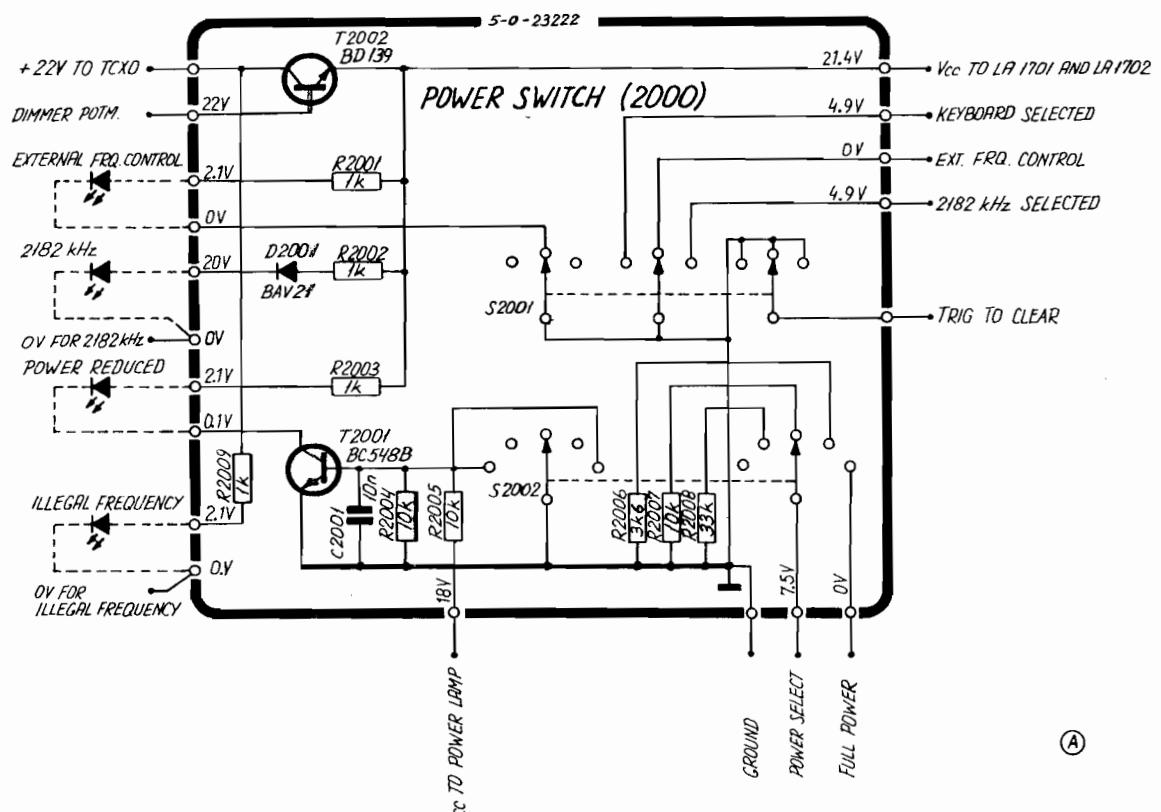

The trig to clear information is a 5 Volt pulse, which clears the display when the display input switch is activated.

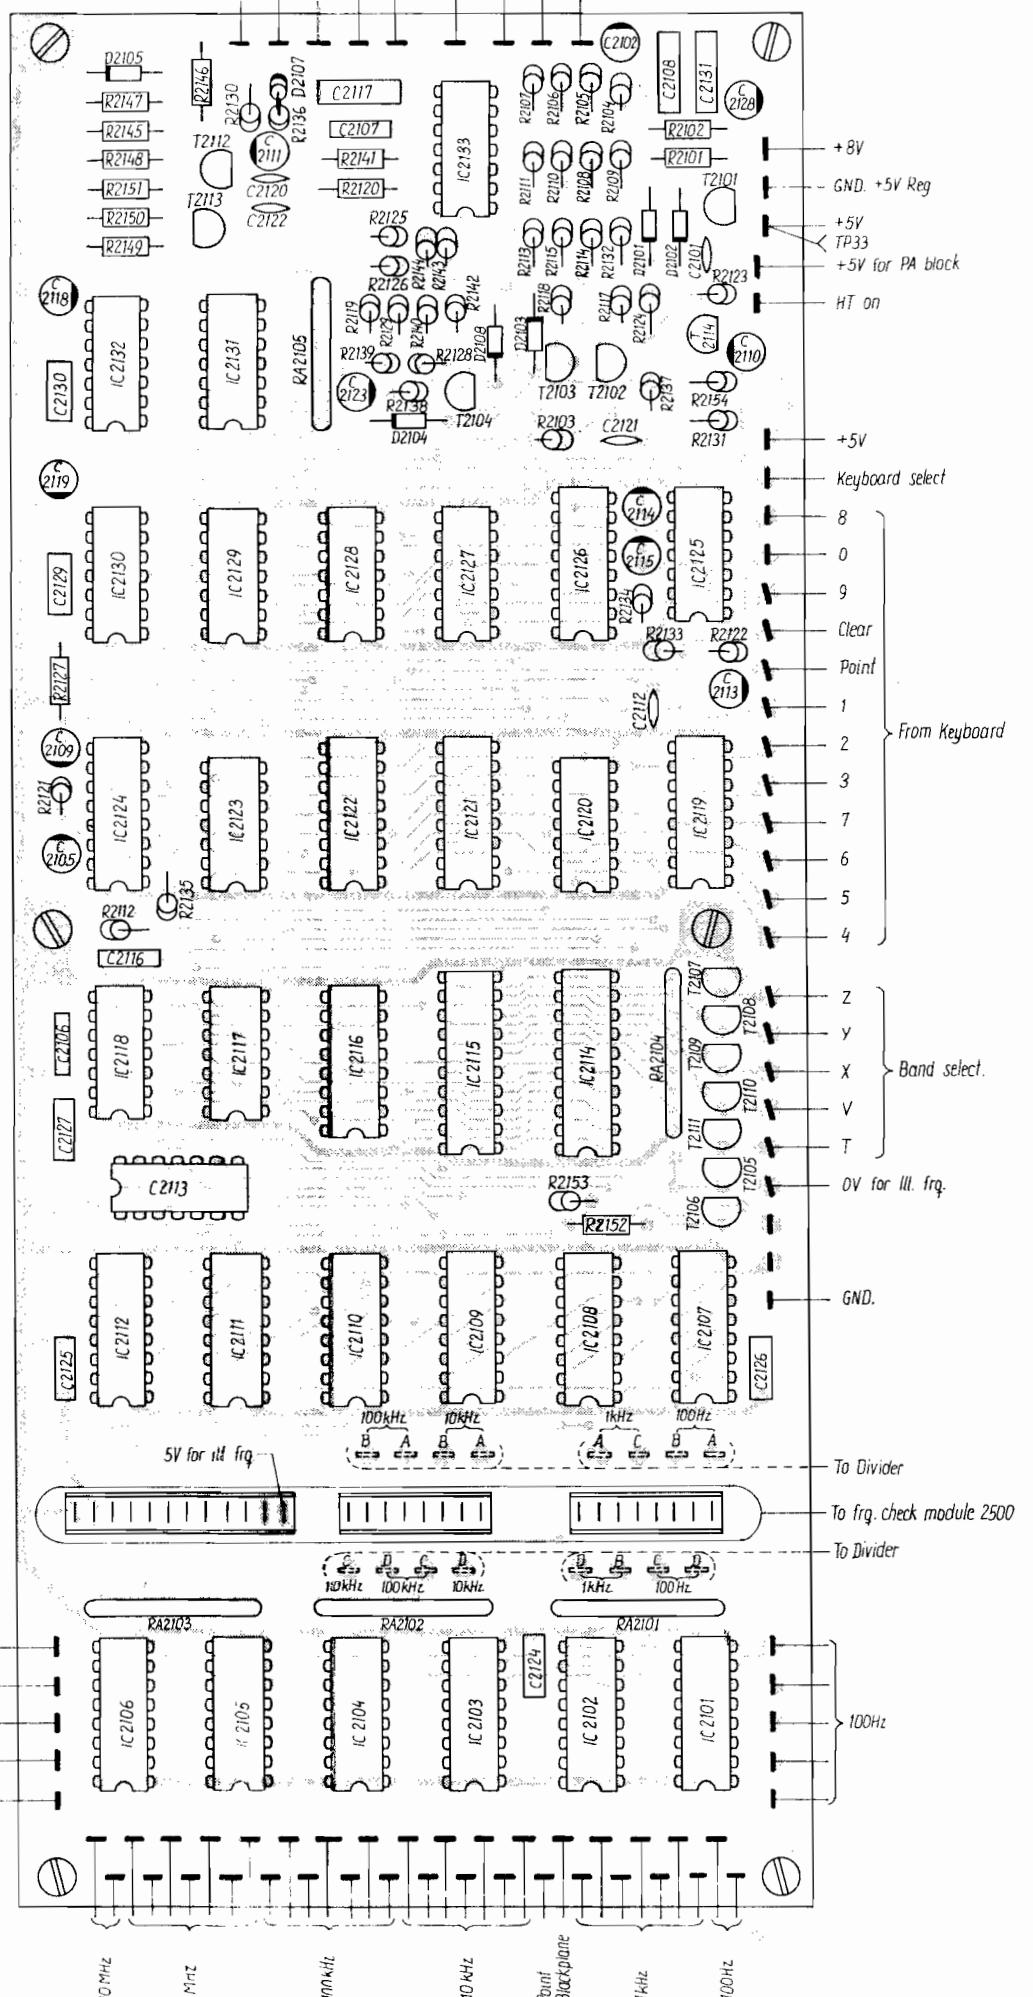

TEST CONDITIONS

Frequency:	EXTERNAL FRQ CONTROL
Power level:	POWER REDUCED (two steps)
Dimmer:	FULL ALIGHT
DC voltmeter input:	10 Mohm
All voltage statements are typical.

FREQUENCY CONTROL (2100)

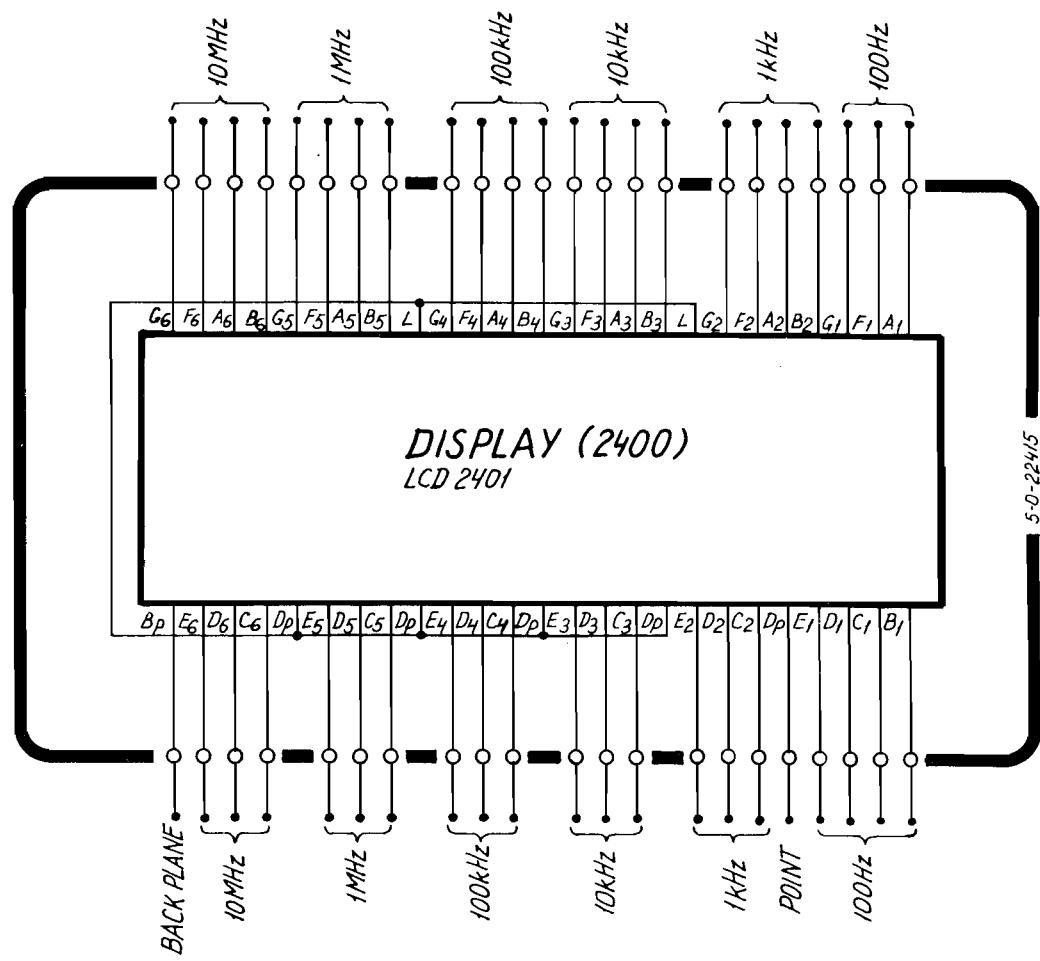

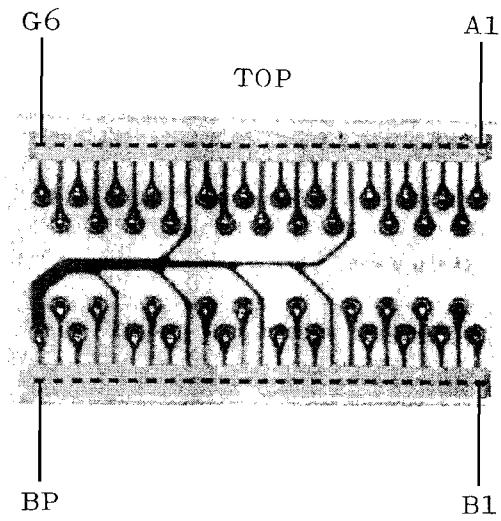

A S1303/4
4-0-22413

A S1303/4
4-0-22415

CIRCUIT DESCRIPTION FREQUENCY CHECK S1304

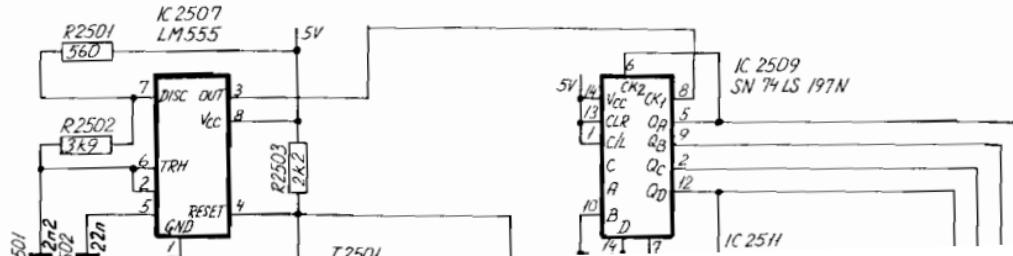

The frequency check unit receives the frequency information from the frequency control unit as six digits in BCD code. This frequency is compared to 256 programmable frequencies which are contained in 3 proms IC2508, IC2510, and IC2512. By a positive comparison a "0" at the output "5V FOR ILLEGAL FREQUENCY" will unblock the PA stage via the frequency control unit.

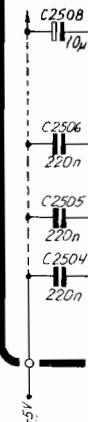

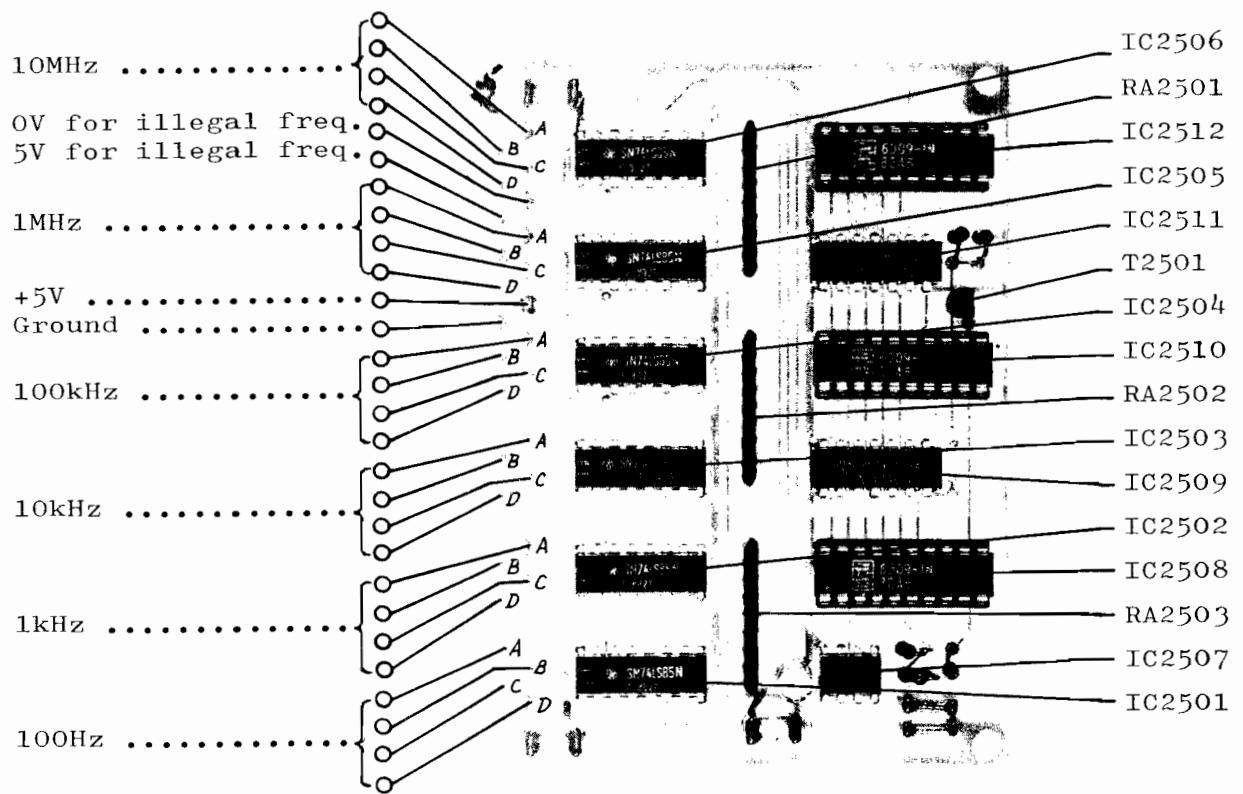

The comparison takes place in 6 comparators (IC2501 - IC2506) with the actual frequency at the B inputs and the prom outputs at the A inputs. If A = B the output "A = B out" will be "1".

When seeking for frequency coincidence, the addresses in the proms are stepped through by the counters IC2509 and IC2511. The counters receive the clock pulses from the oscillator IC2502 and it is running until an address with frequency coincidence is found. Then the oscillator is stopped when T2501 is turned on by the "1" from IC2501 pin 6.
