## Driver-unit DR-7236

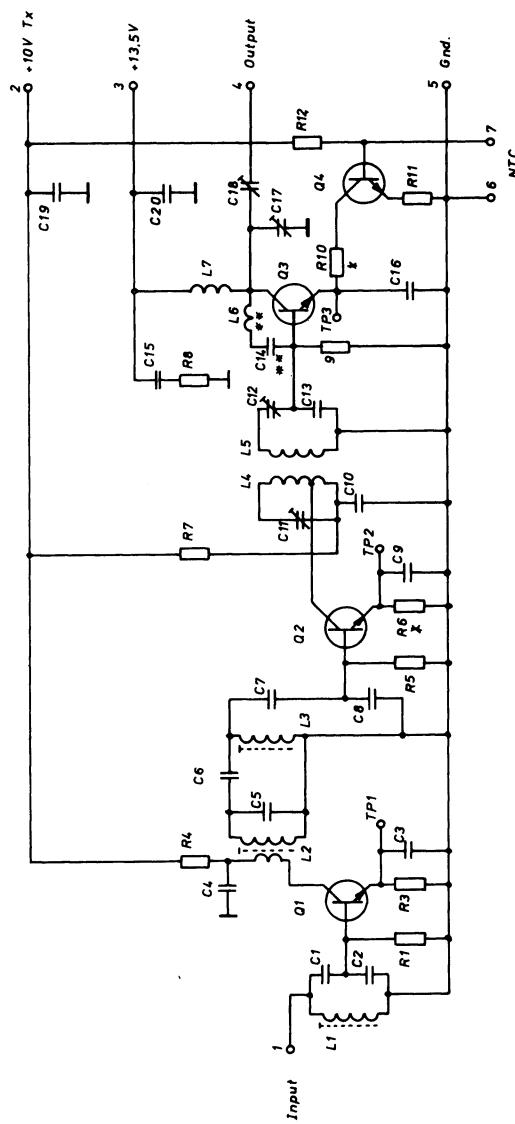

The input circuit L1, C1, and C2 works as impedance matching network to the transistor Q1 which amplifies the signal. The following circuit is tuned to the 2nd harmonic of the signal delivered by the transmitter-multiplier-unit. Transistor Q2 amplifies the signal, and is impedance matched to transistor Q3 by the circuit L4, L5, C11, C12, and C13.

The output power of about 0.5 W is reached by amplification of the signal in transistor Q3.

The driver and PA unit are protected against too high temperatures by a NTC-resistor controlling the basis-emitter voltage of transistor Q4 at high temperatures. The NTC-resistor is placed on the heat sink where the transistors Q1 and Q2 from the PA-unit are mounted.
