# GENERAL DESCRIPTION

## INTRODUCTION

SAILOR R1121 is a scanning receiver intended for reception of F1 radiotelex signals.

SAILOR R1121 covers the following bands:

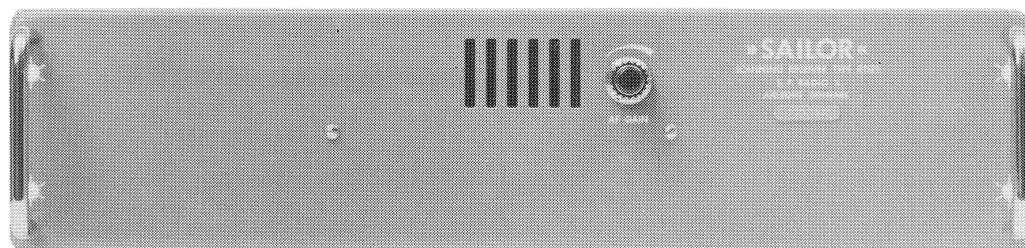

1.60 MHz - 3.80 MHz  
4.20 MHz - 4.36 MHz  
6.32 MHz - 6.51 MHz  
8.43 MHz - 8.72 MHz  
12.65 MHz - 13.11 MHz  
16.85 MHz - 17.24 MHz  
22.31 MHz - 22.60 MHz

SAILOR R1121 uses a digital synthesizer for frequency generation, and thus it can be set to any frequency in the above mentioned frequency ranges. The digital synthesizer is controlled from keyboard of the V.D.U. via a built-in microprocessor. The frequency stability is controlled from one 10 MHz TCXO.

SAILOR R1121 is provided with high order RF band pass filter to ensure good communication performance.

SAILOR R1121 scanning facilities are controlled from V.D.U. keyboard via the ARQ H1240.

SAILOR R1121 can be supplied with a self-contained cabinet H1225 and an AC/DC power supply N1405.

R1121 A

# TECHNICAL DATA

The receiver is fully synthesized and has a frequency resolution of 100 Hz.

The receiver is intended for reception of the following wave types F1 (F1B)

Frequency Ranges: 1.6 - 3.8 MHz and the maritime radiotelex HF bands (4 - 22 MHz)

Frequency Drift, Short Time: less than 5 Hz

Frequency Drift, Long Time: less than 20 Hz per year

Frequency Drift: 0 - 40°C: less than 20 Hz  
also possibility for better figures for frequency drift when using another TCXO.

<u>IF Bandwidth:</u>	Min.passband at -6 dB	Max. pass band at -60 dB	Classification of reception	
			old	new
	+150 Hz -150 Hz	-750 Hz +750 Hz	F1	F1B

Sensitivity, 20 dB SN/N: <5 dB/1 uV

Blocking: wanted signal 20 dB/1 uV  
blocking level >100 dB/1 uV

Intermodulation: wanted signal 30 dB/1 uV  
3rd order intermodulation f = 30 kHz  
intermodulation level >90 dB/1 uV

Operation Temperature Range: -15°C to +55°C

Spurious Rejection: 0 - 30 MHz: >80 dB

Spurious Emission:  $P_{out} < 0.1 \text{ nW}$  into 50 ohm

Audio Outputs:

Loudspeaker 4W into 8 ohm  
Line 0 dBm into 600 ohm

Automatic Gain Control:

$\Delta V_{in} = 40 \text{ dB}$  attack time <2mS  
decay time approx. 80 mS

IF Frequencies: 1st IF: 10.6085 MHz & 16.6085 MHz  
2nd IF: 600 kHz

R1121 A

# SCANNING FACILITIES FOR SAILOR AUTOMATIC RADIOTELEX STATION

Possibility for 15 radio stations with call-code and name.

Each station has 7 receiving and transmitting frequencies.

The scanning table can by the operator be created with up to 21 frequency pairs.

The 15 groups are named A to O.

The first 5 groups from A to E can only be stored with the strap W8 not inserted.

The last 10 groups from F to O can be stored by the operator and later changed if necessary.

The 7 frequency pairs in each group is named from A1 to A7 and O1 to O7 etc.

## STATION TABLE CONTROL

To enter call-code and name into the station table.

**STN A** = (call-code)(name)(return)

**STN B** = (call-code)(name)(return)

etc.

To erase one group (A) from the station table.

**CREATE A** (return)

To enter receive and transmit frequencies into the station table.

**STN A1** = (receive frequency)(transmit frequency)(return)

**STN A2** = (receive frequency)(transmit frequency)(return)

etc.

To erase the frequency in A1.

**STN A1** = (∅.∅)(∅.∅)(return)

etc.

Listing of:

**STN** (return) List all the stored stations, call-code and name.

**STN A** (return) List station A particulary.

**STN A1** (return) List A1 frequency pair.

## SCANNING CONTROL

The scanning table can be stored into default (the non-volatile memory).

When power-up and after power failure the default channels will be loaded into the scanning table.

To create a scanning table:

**SCAN, A, B1, B7, F** (return) for A it is the complete group.

## SCANNING FACILITIES FOR SAILOR AUTOMATIC RADIOTELEX STATION cont.

To delete or add channels into the scanning table:

**ADD C2, B3** (return)

**DELETE A, B1** (return)

To store the scanning table into default.

**STORE** (return)

To scan the default channels:

**SCAN X** (return)

or

**SCAN A1, X** (return)

To stop the scanning.

**STOP** (return)

**SCAN A1** (return). Only one channel.

To stop the scanning when receiving a free-signal.

**SEL** (return)

**DESEL** (return) (to annulment).

To list the scanning table:

**SCAN** (return)

### COMMUNICATION CONTROL COMMANDS

FEC and ARQ mode can only be used after a STOP command or when a single channel is scanned.

**FEC** (return)

**ARQ** (return) use the call-code and name related to the STATION TABLE.

**ARQ 12345** (return)

**ARQ A to 0** (return) use the call-code and name related to the STATION TABLE.

**ARQ R** (return) repeat the call with the last used call-code.

When using the CABLE command the call will first be initiated when receiving a free-signal.

To initiate a call at the first free channel:

**CALL** (return) call the first free channel in the scanning sequence.

**CALL 12345** (return)

**CALL A to 0** (return) use the call code and name related to the STATION TABLE.

**CALL R** (return) repeat the call with the last used call-code.

When the station is waiting for a free-signal from e.g. LYNGBY, all the other channels in the scanning table will be checked for an incoming call.

R1121 A

# OPERATING INSTRUCTIONS FOR AUTOMATIC RADIOTELEX STATION

SAILOR R1121 can receive in the maritime telex frequencies.

SAILOR S1303/04 can be set for any frequency in the ranges 1.6 - 8.4 MHz and the 12-16-22-25 MHz maritime HF bands.

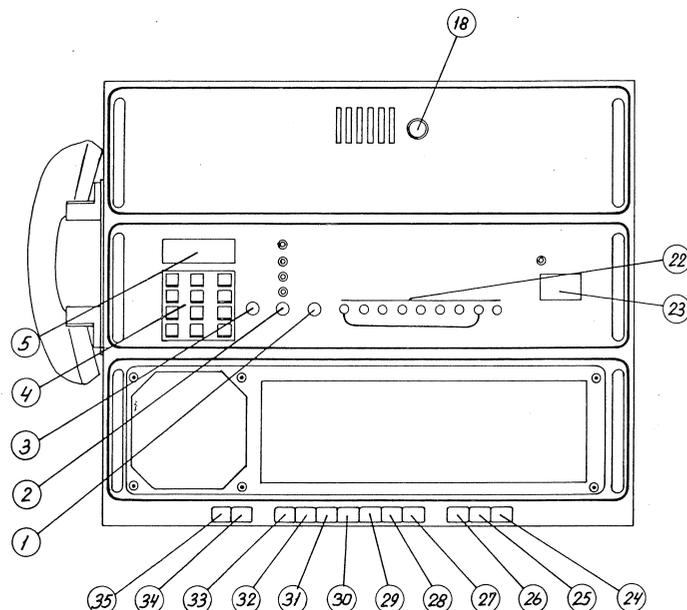

## AUTOTELEX

1. Switch on the station by activating the ON (24) button.
2. Turn the AF GAIN (18) to suitable volume.
3. Turn DISTRESS SWITCH (3) to center position. (EXTERNAL FREQUENCY CONTROL).
4. Turn POWER SWITCH (2) fully clockwise.
5. Press the button TELEX (22).
6. Press the button SIMPLEX TWO AERIALS (32).
7. Turn on the ARQ H1240.
8. The station is now ready for operation.
9. For manual communication use Communication Procedure 1.13. Stop the scanner on the station wanted and activate an ARQ Call. E.g. ARQ D Return.
10. For automatic call in MARITEX mode use the soft keys.  
E.g.  
CALL - AUTOTX (soft keys).

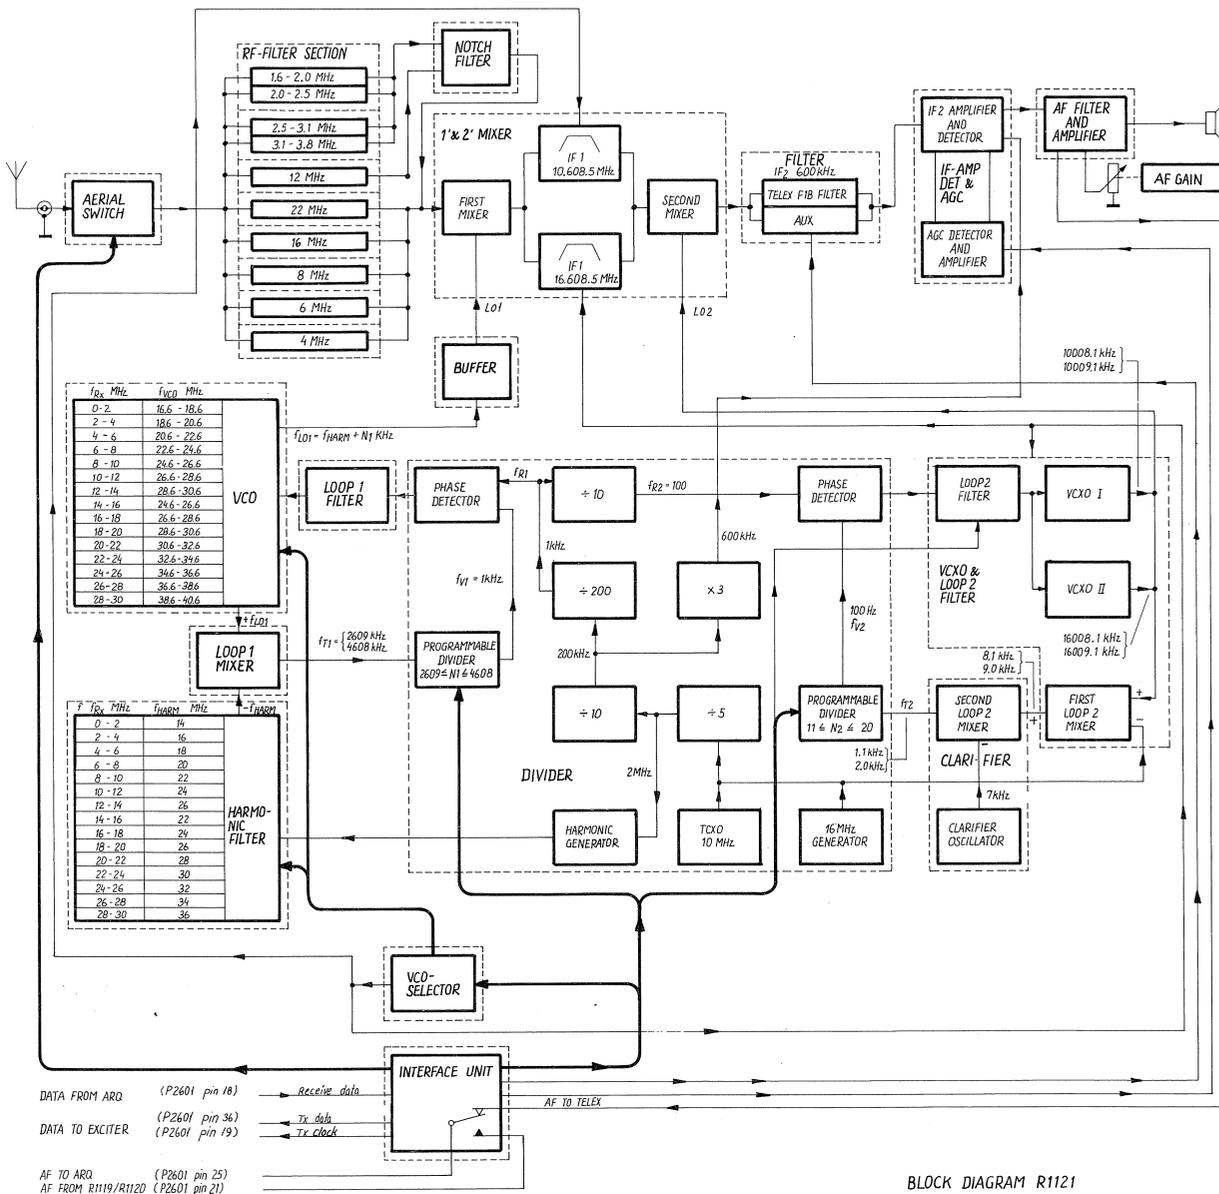

A-Space-TLX1235678+-letter-Return (keyboard)

**Important!** The working frequency for radiotelex communication is given as assigned frequency (center frequency for the modulation). The frequencies in the quick select register (the STATION TABLE) must be the carrier frequency.

The carrier frequency = assigned frequency - 1700 Hz.

# PRINCIPLE OF OPERATION

BLOCK DIAGRAM R1121

R1121 B1/5  
4-0-25205

## RECEIVER R1121

The SAILOR R1121 is a fully synthesized double superheterodyne receiver with 10.6085 MHz or 16.6085 MHz 1st IF and 600 kHz 2nd IF.

The signal from the aerial is led through the band filter unit to the first mixer where the aerial signal is mixed with the  $f_{L01}$  signal having frequency resolution of 1 kHz, and thus giving a 1st IF frequency range from 10.6081 MHz to 10.6090 MHz or 16.6081 MHz to 16.6090 MHz.

## PRINCIPLE OF OPERATION cont.

The signal is then led through a double monolithic crystal filter to the second mixer, where the signal is mixed with the  $f_{L02}$  signal having a frequency resolution of 100 Hz in the frequency range from 10.0081 MHz to 10.0090 MHz or 16.0081 MHz to 16.0090 MHz, and thus giving a 2nd IF frequency of 600 kHz.

The 16.6085 MHz 1st IF is selected in the frequency range 0.0100 MHz to 13.9999 MHz and 16.6085 MHz in the range 14.0000 MHz to 29.9999 MHz.

The produced 2nd IF signal is led through the standard telex FIB filter or an optional filter. The switching of the filters is controlled through the interface unit.

The signal is then passed on to the IF2 amplifier and detector. The IF amplifier consists of 3 AGC controlled amplifier stages. The detector is an envelope detector, and the carrier is reinjected in such a way that the incoming signal is converted to an A3H signal.

The reinjected carrier in SSB mode is 600 kHz derived from the 10 MHz reference oscillator.

The AGC detector and amplifier consists of a fast telex AGC system and the SSB AGC system. The switching between the two systems is done by the interface unit.

The audio frequency signal is fed from the detector to the AF filter and amplifier, consisting of an audio filter, a preamplifier and an output power amplifier, which delivers signal to the fixed AF output (0 dBm) and the speaker. The fixed AF output is led to relay located on the interface unit PCB and through that further on to plug P2601. Through switching of the relay it can be chosen whether the internal AF-signal in R1121 or an AF-signal coming from external equipment must be led on to the ARQ. The switching of relay is controlled by the interface unit.

The necessary frequencies are generated by two frequency synthesizers according to the phase locked principle.

Local oscillator signal  $f_{L01}$  to first mixer is generated in the phase locked loop 1 and has a resolution of 1 kHz.

Local oscillator signal  $f_{L02}$  to second mixer is generated in the phase locked loop 2 and has a resolution of 100 Hz.

### LOOP 1

The voltage controlled oscillator (VCO) generates the necessary local oscillator signal to first mixer in twelve 2 MHz bands selected by the band control unit. Inside each 2 MHz band the VCO frequency  $f_{L01}$  is controlled by a DC controlled voltage derived from the phase detector and filtered out in the LOOP 1 filter.

The phase detector compares two signals, a variable frequency  $f_{V1}$  and a reference frequency  $f_{R1}$ . The reference frequency  $f_{R1}$  is the 10 MHz TCXO frequency divided down to 1 kHz.

The variable frequency  $f_{V1}$  is generated from the VCO frequency  $f_{L01}$  in the following way:

In the loop 1 mixer the counter frequency  $f_{T1}$  is produced as the difference between the VCO frequency  $f_{L01}$  and the frequency  $f_{HARM}$  which is a multiple of 2 MHz derived from the 10 MHz TCXO.

## PRINCIPLE OF OPERATION cont.

$$f_{T1} = f_{L01} - f_{HARM} = f_{L01} - (m \times 2 \text{ MHz}) = N_1 \times 1 \text{ kHz}$$

For each 2 MHz band a new  $f_{L01}$  and  $f_{HARM}$  is selected by the band control unit, and it always results in a 2 MHz variation of the frequency  $f_{T1}$  to programmable divider.

The frequency  $f_{T1}$  is divided down by a dividing figure  $N_1$  in the programmable divider to the variable frequency  $f_{V1}$ .

$$f_{V1} = f_{T1}/N_1 = 1 \text{ kHz}$$

The working principle in a phase locked loop is as follows:

A frequency error between the variable frequency  $f_{V1}$  and the reference frequency  $f_{R1}$  will via the phase detector and the loop 1 filter cause a DC control voltage controlling the VCO frequency and consequently the variable frequency  $f_{V1}$  so that  $f_{V1}$  follows the reference frequency  $f_{R1}$  in frequency.

$$f_{R1} = f_{V1} = 1 \text{ kHz}$$

The VCO frequency  $f_{L01}$  is now phase locked on a fixed frequency to the reference frequency  $f_{R1}$  and has therefore the same accuracy as this.

Changing of the VCO frequency  $f_{L01}$  by 1 kHz is carried out by changing the dividing figure  $N_1$  in the programmable divider by one.

$$f_{L01} = f_{HARM} + (N_1 \times 1 \text{ kHz})$$

Principle of programming:

The programmable divider contains a counter circuit counting down from a start figure  $2000 + P_1$  and stops at the stop figure  $S_1$ . Each time the counter reaches the stop figure  $S_1$ , a pulse ( $f_{V1}$ ) is fed to the phase detector, and the counter starts counting down again from the start figure  $2000 + P_1$ . Division of  $f_{T1}$  by  $N_1$  is now achieved.

$$f_{V1} = f_{T1}/N_1; N_1 = 2000 + P_1 - S_1$$

The band control unit selects the correct VCO- and harmonic filter range.

Inside each 2 MHz band the programmable figure  $P_1$  is encoded from the key board control unit in BCD code representing the frequency within the 2 MHz band.

$$\text{Start figure: } 2000 + P_1; 0 \leq P_1 \leq 1999$$

$$\text{Stop figure: } S_1 = -609$$

$$N_1 = 2000 + P_1 - S_1 = P_1 + 2609$$

Output frequency from Loop 1:

$$f_{L01} = m \times 2 \text{ MHz} + (P_1 + 2069) \times 1 \text{ kHz}; 7 \leq m \leq 18$$

## PRINCIPLE OF OPERATION cont.

### LOOP 2

The voltage controlled crystal oscillator (VCXO) generates the necessary local oscillator signal to second mixer. The VCXO is in the loop 2 system phase locked to the internal 10 MHz reference frequency.

The phase locked loop principle is the same as for the loop 1 system. The only difference is that there are two mixers in the feed-back path, where the one injection signal is a fixed 10 MHz or 16 MHz signal and the other one  $f_{CL}$  is the clarifier signal.

The clarifier oscillator is in R1121 adjusted to a fixed frequency of 7 kHz.

Principle of programming:

The frequency shift in loop 2 is controlled from the 0.1 kHz code from the keyboard control unit.

The programmable divider counts up from the start figure  $P_2$  to the stop figure  $S_2$ .

The 0.1 kHz code controls the start figure  $P_2$  to the programmable divider.

$$\text{Start figure: } 0 \leq P_2 \leq 9$$

$$\text{Stop figure: } S_2 = 20$$

$$\text{Dividing figure: } N_2 = S_2 - P_2 = 20 - P_2$$

Output frequency from loop 2:

$$f_{L02} = 10 \text{ MHz} + f_{CL} + (N_2 \times 0.1 \text{ kHz})$$

$$f_{L02} = 10.007 \text{ MHz} + (20 - P_2) \times 0.1 \text{ kHz}$$

$$f_{L02} = 10.009 \text{ MHz} - (P_2 \times 0.1 \text{ kHz})$$

or:

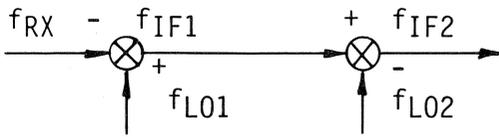

$$f_{L02} = 16 \text{ MHz} + f_{CL} + (N_2 \times 0.1 \text{ kHz})$$

$$f_{L02} = 16.007 \text{ MHz} + (20 - P_2) \times 0.1 \text{ kHz}$$

$$f_{L02} = 16.009 \text{ MHz} - P_2 \times 0.1 \text{ kHz}$$

PRINCIPLE OF OPERATION cont.

RECEIVING FREQUENCY  $f_{RX}$  FOR RECEIVER R1121

$$f_{IF2} = 0.600 \text{ MHz}$$

$$f_{L02} = \begin{matrix} 10.009 \text{ MHz} - (P_2 \times 0.1 \text{ kHz}) \\ 16.009 \text{ MHz} - (P_2 \times 0.1 \text{ kHz}) \end{matrix}$$

$$f_{IF1} = f_{IF2} + f_{L02} = \begin{matrix} 10.009 \text{ MHz} - (P_2 \times 0.1 \text{ kHz}) \\ 16.009 \text{ MHz} - (P_2 \times 0.1 \text{ kHz}) \end{matrix}$$

$$f_{L01} = m \times 2 \text{ MHz} + (P_1 + 2609) \times 1 \text{ kHz}, \quad 7 \leq m \leq 18$$

For  $0.0100 \text{ MHz} < f_{RX} \leq 13.9999 \text{ MHz}$

$$f_{RX} = f_{L01} - f_{IF1} = (m-4) \times 2 \text{ MHz} + (P_1 + 0.1 P_2) \times 1 \text{ kHz}$$

For  $14.0000 \text{ MHz} < f_{RX} \leq 29.9999 \text{ MHz}$

$$f_{RX} = f_{L01} - f_{IF1} = (m-7) \times 2 \text{ MHz} + (P_1 + 0.1 P_2) \times 1 \text{ kHz}$$

R1121 B5/5

## AERIAL TUNE-UP PROCEDURE

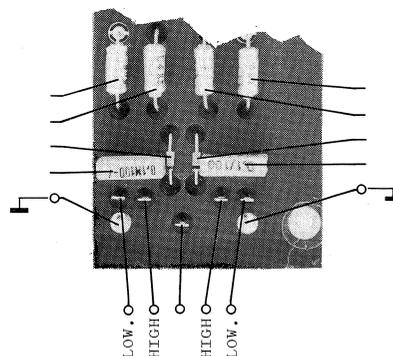

For coaxial cable length from aerial to receiver above 12 m, no tuning is necessary when installing the receiver, since all RF-filter sections are from factory set for 50 ohm input impedance.

In the RF-filter sections covering the CT-band 1.6 - 3.8 MHz there is the possibility of changing the input impedance from 50 ohm to approx. 300 ohm. This may be advantageous for installations with short coaxial cables 1-12 m.

In the RF-filter sections covering the short wave band, the input impedance cannot be changed from 50 ohm.

### ADJUSTMENT PROCEDURE CT-BAND

1. Connect the aerial to the input terminal of the receiver.
2. Select a frequency in the range of respectively 1.6 - 2.0 MHz, 2.0 - 2.5 MHz, 2.5 - 3.1 MHz, and 3.1 - 3.8 MHz.
3. Connect a voltmeter to TP19 and notice the voltage.
4. Change the input impedance of the filter used from low to high as shown below, and notice the AGC-voltage again.
5. Choose the strapping of impedance which gives the largest AGC-voltage.
6. Execute this adjustment for all four RF-filter sections covering the CT-band.

## SERVICE

1. MAINTENANCE
2. NECESSARY TEST EQUIPMENT
3. TROUBLE-SHOOTING
4. PERFORMANCE CHECK
5. ADJUSTMENT PROCEDURE
6. NECESSARY ADJUSTMENTS AFTER REPAIR
7. FUNCTION CHECK
8. MECHANICAL DISASSEMBLING T1127 ONLY

### 1. MAINTENANCE

When the SAILOR short wave programme 1000 has been correctly installed, the maintenance can, dependent on the environments and working hours, be reduced to a performance check at the service workshop at intervals not exceeding 5 years. A complete performance check list is enclosed in the PERFORMANCE CHECK section.

Also inspect the antennas, cables and plugs for mechanical defects, salt deposits, corrosion and any foreign bodies.

Along with each set a test sheet is delivered, in which some of the measurings made at the factory are listed. If the performance check does not show the same values as those on the test sheet, the set must be adjusted as described under ADJUSTMENT PROCEDURE.

Any repair of the set should be followed by a FUNCTION CHECK of the unit in question.

R1121

### 3. TROUBLE-SHOOTING

Trouble-shooting should only be performed by persons with sufficient technical knowledge, who have the necessary test equipment at their disposal, and who have carefully studied the operation principles and structure of the unit in question.

Start to find out whether the fault is somewhere in the antenna circuit, the power source, or in the short wave set.

For help with trouble-shooting in the short wave set there is a built-in test meter and test meter switch, located behind the air filter on the power supply.

When the fault has been located to a certain unit look up the performance check list in the instruction book and make relevant performance check to incircle the fault. Then look-up the CIRCUIT DESCRIPTION section. This section contains schematic components. (ADJUSTMENT LOCATIONS). Typical AC and DC voltages are indicated on the schematic diagrams.

No adjustment must take place unless the service workshop has the necessary test equipment to perform the adjustment procedure in question.

After repair or replacement of the module look-up the section NECESSARY ADJUSTMENTS AFTER REPAIR to see, whether the unit has to be adjusted or not.

Anyway the unit has to have a complete function check after repair.

#### **TROUBLE-SHOOTING IN THE FREQUENCY GENERATING CIRCUIT**

##### **LOOP 1**

If the fault has been located to Loop 1 the following hints can be used for trouble-shooting.

If there is no output signal from the VCO the fault has to be found in the VCO-unit.

If the output frequency from the VCO is lower than the low frequency limits or higher than the high frequency limits of the 2 MHz band in question, the phase-locked Loop 1 is out of lock. For VCO frequencies look-up the section PRINCIPLE OF OPERATION.

1. Check the Loop 1 mixer output signal on the terminal "Loop 1 out", module 1400.
  - a. If there is no output signal, the failure is on Loop 1 mixer, harmonic filter unit or VCO-unit.
  - b. If the output frequency is approx. 2 MHz or approx. 5 MHz, the VCO-unit, Loop 1 mixer and the harmonic filter unit are apparently ok.
2. Check that the frequency on the phase/frequency detector IC1006, pin 1 is 1 kHz.

### 3. TROUBLE-SHOOTING cont.

3. Check the Loop 1 programmable divider, module 1000.
  - a. If the frequency on the input terminal "Loop 1 In" is approx. 2 MHz and the frequency on the phase/frequency detector IC1006, pin 3 is lower than 1 kHz, the programmable divider is apparently ok.
  - b. If the frequency on terminal "Loop 1 In" is approx. 5 MHz and the frequency on the phase/frequency detector IC1006, pin 3 is higher than 1 kHz, the programmable divider is apparently ok.
4. Check the phase/frequency detector IC1006.
  - a. Measure 1.5V DC on "PD1 Out" on the divider unit.
  - b. If the input frequency on IC1006, pin 3 is higher than 1 kHz and the DC-voltage on "PD1 Out" is approx. 0.7V, the phase/frequency detector is apparently ok.
  - c. If the input frequency on IC1006, pin 3 is lower than 1 kHz and the DC-voltage on "PD1 Out" is approx. 2.3V, the phase/frequency detector is apparently ok.
5. Check the integrator IC1102 on Loop 1 filter & +-18V supply unit, module 1100.
  - a. IF the DC-voltage on "PD1 In" is approx. 0.7V and the DC-voltage on output terminal of IC1102, pin 6 is approx. -4V, the integrator IC1102 is apparently ok.
  - b. If the DC-voltage on "PD1 In" is approx. 2.3V and the DC-voltage on the output terminal of IC1102, pin 6 is approx. -17V, the integrator IC1102 is apparently ok.
6. If the failure has not been found yet the 1 kHz loop filter IC1101 and the selection circuit for choosing VCO- and harmonic filter must be checked.

### LOOP 2

If the fault has been located to Loop 2 the following hints can be used for trouble-shooting.

If there is no output signal from the VCX0, 1st Loop 2 mixer and Loop 2 filter on terminal "LO2 Out", the failure has to be found in the VCX0.

If the output frequency from the VCX0, 1st Loop 2 mixer and Loop 2 filter on terminal "LO2 Out" is lower than 10.008 MHz or higher than 10.009 MHz, respectively 16.008 MHz and 16.009 MHz, the phase-locked Loop 2 is out of lock.

1. Check the output signal from VCX0, 1st Loop 2 mixer and Loop 2 filter on terminal "First Loop 2 Out".
  - a. If there is no output signal, the failure is in the 1st Loop 2 mixer or that the 10 MHz and/or 16 MHz injection signal is missing.
  - b. If the output frequency is slightly lower than 8 kHz or slightly higher than 9 kHz the VCX0, the 1st Loop 2 mixer and the 10 MHz and/or 16 MHz injection signal are apparently ok.

### 3. TROUBLE-SHOOTING cont.

2. Check the output signal on TP10 on the clarifier and 2nd Loop 2 mixer, module 1700.
  - a. If there is no output signal, the failure is on the clarifier and 2nd Loop 2 mixer circuit board.
  - b. If the output frequency is lower than 1 kHz or higher than 2 kHz, then the clarifier and 2nd Loop 2 mixer are apparently ok.
3. Check that the frequency on the phase/frequency detector IC1013, pin 1 is 100 Hz.
4. Check the Loop 2 programmable divider.
  - a. If the frequency on terminal "Loop 2 In", module 1000 is lower than 1 kHz and the frequency on the phase/frequency detector IC1013, pin 3 is lower than 100 Hz, the programmable divider is apparently ok.
  - b. If the frequency on terminal "Loop 2 In", module 1000 is higher than 2 kHz and the frequency on the phase/frequency detector IC1013, pin 3 is higher than 100 Hz, the programmable divider is apparently ok.
5. Check the phase/frequency detector IC1013.
  - a. Measure 1.5V DC on terminal "PD 2 Out" on the divider unit.
  - b. If the input frequency on IC1013, pin 3 is lower than 100 Hz and the DC voltage on terminal "PD 2 Out" is approx. 0.7V, the phase/frequency detector is apparently ok.
  - c. If the input frequency on IC1013, pin 3 is higher than 100 Hz and the DC voltage on terminal "PD 2 Out" is approx. 2.3V, the phase/frequency detector is apparently ok.
6. Check the integrator IC1601b on VCX0, 1st Loop 2 mixer and Loop 2 filter.
  - a. If the DC voltage on TP9 is approx. 0.7V and the DC voltage on output terminal IC1601b, pin 1 is approx. 17V, the integrator is apparently ok.
  - b. If the DC voltage on TP9 is approx. 2.3V and the DC voltage on the output terminal of IC1601b, pin 1 is approx. 1V, the integrator is apparently ok.
7. If the failure has not yet been found, the summing amplifier IC1601a and the loop filter C1614 and R1616 must be checked.

## 4. PERFORMANCE CHECK

### GENERAL

Before executing the performance check, connect the receiver to power supply and radiotelex modem as described in this manual, section 2. NECESSARY TEST EQUIPMENT.

The selection of receiver frequency  $f_{RX}$  is always done by means of the radiotelex modem H1240, the keyboard processor H1249 and the video monitor H1253.

#### 4.1. DEFINITIONS USED - LOCATIONS.

4.1.1. Definitions used, refer to 5.1.

4.1.2. Locations refer to ADJUSTMENT LOCATIONS.

#### 4.2. CHECK OF $\pm 18V$ SUPPLY UNIT.

4.2.1. Connect the voltmeter to TP2.

4.2.2. Check that the voltage is  $+18V \pm 0.2V$ .

4.2.3. Connect the voltmeter to TP1.

4.2.4. Check that the voltage is  $-18V \pm 0.2V$ .

#### 4.3. CHECK OF $+5V$ REGULATOR.

4.3.1. Connect the voltmeter to pin 3 of IC2602.

4.3.2. Check that the voltage is  $5V \pm 0.2V$ .

#### 4.4. CHECK OF TCXO

The receiver must be ON for at least 5 minutes.

4.4.1. Connect the counter to TP3.

#### 4.4.2.

Check that the frequency is  $10,000,000 \pm 1$  Hz.

#### 4.5.

##### CHECK OF HARMONIC FILTERS.

##### 4.5.1.

Connect the voltmeter to TP24.

##### 4.5.2.

Select the following frequencies  $f_{RX} = 0-2-4-6-8-10-12-20-22-24-26-28$  MHz.

##### 4.5.3.

Check the voltage to be  $1.9V \pm 0.6V$ .

#### 4.6.

##### CHECK OF VCO

##### 4.6.1.

Connect the voltmeter to TP11.

##### 4.6.2.

Select the following  $f_{RX} = 1.999-3.999-5.999-7.999-9.999-11.999-13.999-21.999-23.999-25.999-27.999-29.999$  MHz.

##### 4.6.3.

Check the voltage to be  $-15V \pm 1V$ .

##### 4.6.4.

Select the following  $f_{RX} = 0-2-4-6-8-10-12-20-22-24-26-28$  MHz.

##### 4.6.5.

Check the voltage to be  $-7.0V \pm 1.5V$ .

#### 4.7.

##### CHECK OF CLARIFIER OSC. & 2ND LOOP 2 MIXER.

##### 4.7.1.

Select  $f_{RX} = 2$  MHz.

#### 4. PERFORMANCE CHECK cont.:

4.7.2.

Connect the counter to TP4.

4.7.3.

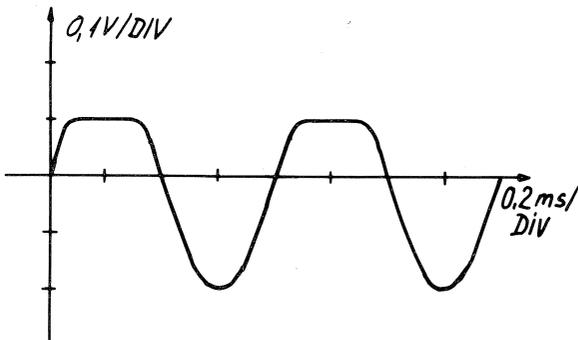

Check the frequency to be 9000 Hz  $\pm 10$  Hz.

4.7.4.

Connect TP10 to oscilloscope through passive probe.

4.7.5.

Check that the waveform is as shown below.

4.7.6.

Select  $f_{RX} = 20$  MHz.

4.7.7.

Check that the waveform is as shown in 4.7.5.

4.8.

CHECK OF VCX0

4.8.1.

Connect +5V to TP25.

4.8.2.

Select  $f_{RX} = 2$  MHz.

4.8.3.

Connect the voltmeter to TP12.

4.8.4.

Check the voltage to be 14V  $\pm 1$ V.

4.8.5.

Select  $f_{RX} = 2.0001$  MHz and notice a change in meter reading of 0.4V  $\pm 0.1$ V compared to the value found in 4.8.4.

4.8.6.

Select  $f_{RX} = 2.0002$  MHz and notice a change in meter reading of 0.9V  $\pm 0.2$ V compared to the value found in 4.8.4.

4.8.7.

Select  $f_{RX} = 2.0004$  MHz and notice a change in meter reading of 1.8V  $\pm 0.4$ V compared to the value found in 4.8.4.

4.8.8.

Select  $f_{RX} = 2.0008$  MHz and notice a change in meter reading of 3.8V  $\pm 0.8$ V compared to the value found in 4.8.4.

4.8.9.

Remove +5V from TP25.

4.8.10.

Select  $f_{RX} = 2$  MHz and check the voltage to be below 13V.

4.8.11.

Select  $f_{RX} = 22$  MHz and check the voltage to be below 13V.

4.8.12.

Select  $f_{RX} = 2.0009$  MHz and check the voltage to be above 5V.

4.8.13.

Select  $f_{RX} = 22.5009$  MHz and check the voltage to be above 5V.

4.9.

CHECK OF 600 kHz GENERATOR.

4.9.1.

Connect the diode probe to TP26.

4.9.2.

Check the voltage to be 1V  $\pm 0.2$ V.

4.10.

CHECK OF LOOP 1 STEP RESPONSE

4.10.1.

Connect a 68 ohm resistor across harmonic filter output.

4.10.2.

Connect the passive probe and the scope to TP11.

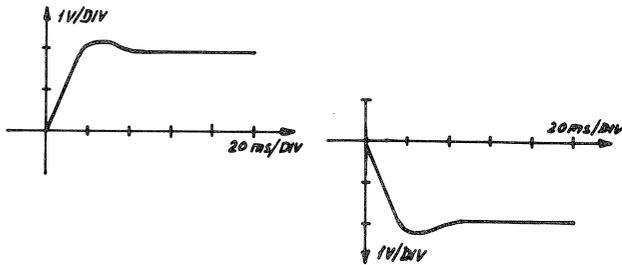

#### 4. PERFORMANCE CHECK cont.:

##### 4.10.3.

Select  $f_{RX} = 22,500.9$  kHz.

##### 4.10.4.

Short-circuit the yellow wire on the 100 kHz data input at the divider board to chassis and check the step response on the scope. Typical waveform is shown below.

##### 4.11.

CHECK OF LOOP 2 STEP RESPONSE

##### 4.11.1.

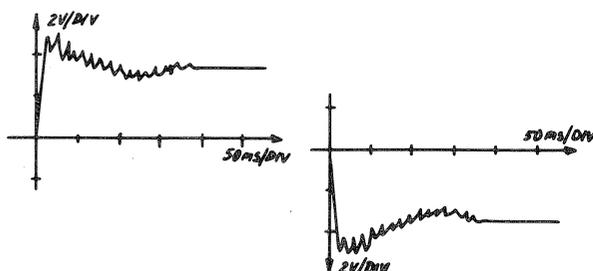

Connect the oscilloscope to TP12 through passive probe.

##### 4.11.2.

Select  $f_{RX} = 22,500.9$  kHz.

##### 4.11.3.

Short-circuit the grey wire on the 100 Hz data input at the divider board to chassis and check the step response on the scope. Typical waveform is shown below.

##### 4.12.

CHECK OF +18V SUPPLY VOLTAGE

##### 4.12.1.

Connect the voltmeter to TP13.

##### 4.12.2.

Measure 18V  $\pm 1.5$ V DC.

##### 4.13.

CHECK OF +17V SUPPLY VOLTAGE

##### 4.13.1.

Connect the voltmeter to TP14.

##### 4.13.2.

Turn AF-gain fully clockwise.

##### 4.13.3.

Measure 17.3V  $\pm 1.5$ V DC.

##### 4.14.

CHECK OF -45V PROTECTION CIRCUIT

##### 4.14.1.

Connect the voltmeter to TP15.

##### 4.14.2.

Measure approx. -45V DC.

##### 4.14.3.

Connect output from exciter S1300/01 to antenna input terminals of the receiver.

##### 4.14.4.

Execute 4.14.5.-7. at the following frequencies: 4.28 MHz, 6.32 MHz, 8.43 MHz, 12.65 MHz, 16.85 MHz and 22.31 MHz.

##### 4.14.5.

Set S1300/01 to FULL POWER, DUPLEX, A3H and turn power level potentiometer fully clockwise.

##### 4.14.6.

Set S1300/01 and the receiver on the same frequency.

##### 4.14.7.

Key S1300/01 by means of the key plug and check that the voltage on TP15 increases.

#### 4. PERFORMANCE CHECK cont.:

4.14.8.

Execute 4.14.9.-11. at one frequency in each of the frequency bands 1.6-2.0 MHz, 2.0-2.5 MHz, 2.5-3.1 MHz, 3.1-3.8 MHz.

4.14.9.

Connect the scope through the passive probe to the anode of the protection diode in the selected RF-filter.

4.14.10.

Execute 4.14.5. and 4.14.6.

4.14.11.

Key S1300/01 by means of the key plug and check by means of the scope that the RF-signal is clipped.

4.15.

CHECK OF LOCAL OSC. INPUTS

4.15.1.

Select  $f_{RX} = 2.0$  MHz.

4.15.2.

Connect the diode probe to TP16.

4.15.3.

Measure  $0.6V \pm 0.15V$ .

4.15.4.

Connect the diode probe to TP17.

4.15.5.

Measure  $3.7V \pm 0.7V$ .

4.15.6.

Select  $f_{RX} = 24$  MHz.

4.15.7.

Execute 4.15.2. - 5.

4.16.

CHECK OF LOOP 1 MIXER

4.16.1.

Select  $f_{RX} = 28$  MHz.

4.16.2.

Connect the diode probe to TP28.

4.16.3.

Measure  $1.3V \pm 0.5V$ .

4.16.4.

Select  $f_{RX} = 29.999$  MHz.

4.16.5.

Connect the diode probe to TP28.

4.16.6.

Measure  $1.3V \pm 0.5V$ .

4.17.

CHECK OF AGC ATTACK- AND DECAY TIME

4.17.1.

Select  $f_{RX} = 2000$  kHz.

4.17.2.

Set the signal generator to  $f_G = 2001.7$  kHz and  $V_G = 1$  mV.

4.17.3.

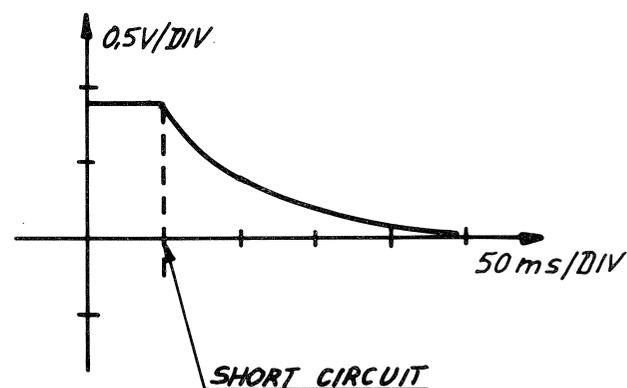

Connect the scope through passive probe to TP19.

4.17.4.

By means of e.g. a trimming tool short-circuit inner and outer conductor on the coax cable leading from IF-filters to IF-amplifier, detector and AGC.

4.17.5.

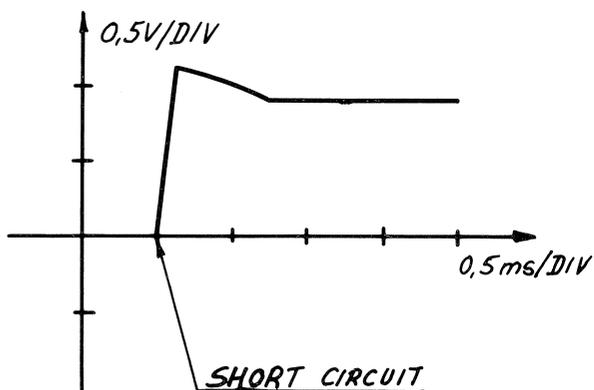

When short-circuiting as mentioned above, no signal will come to the AGC-circuit, which causes the AGC voltage to decay as shown below.

4.17.6.

Removing the short-circuit causes the AGC-voltage to attack as shown below.

4. PERFORMANCE CHECK cont.:

4.18.  
CHECK OF 0 dBm OUTPUT

4.18.1.  
Select  $f_{RX} = 2000$  kHz.

4.18.2.  
Set the signal generator to 2001.7 kHz and  $V_G = 1$  mV.

4.18.3.  
Connect voltmeter and 560 ohm resistor parallel to TP20 and TP21.

4.18.4.  
Measure  $0.9V \pm 0.2V$ .

4.19.  
CHECK OF AF-AMPLIFIER

4.19.1.  
Perform 4.17.1. - 4.17.2.

4.19.2.  
Disconnect the white/green wire leading to TP22.

4.19.3.  
Solder a 4 ohm resistor (min. 10W) to TP22 and connect the oscilloscope probe parallel to the resistor.

4.19.4.  
Turn the AF-gain control fully clockwise and check the AF-voltage to be at least  $15V_{pp}$ .

4.19.5.  
Reduce AF-gain until AF-voltage is  $13V_{pp}$ , and check that a sinusoidal signal is seen (distortion approx. 3%).

4.19.6.  
Remove the 4 ohm resistor and connect the white/green wire to TP22.

4.20.  
CHECK OF SIMPLEX RELAY

4.20.1.  
Connect an ohm-meter to the antenna input terminal and ground.

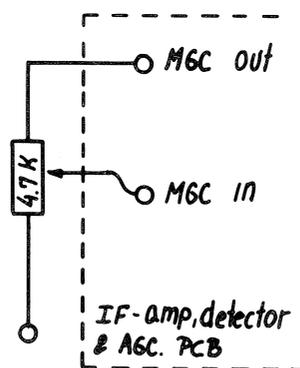

4.20.2.  
Connect TP30 to TP29 with a piece of wire and check that RE101 is activated.

4.20.3.  
Check that the ohm-meter is showing a short-circuit.

4.21.  
SENSITIVITY MEASUREMENT  
**NOTE!** If a distortion meter is at hand, then execute 4.21.5. and check in each case that the signal to noise ratio is at least 20 dB. If no distortion meter is at hand, then execute 4.21.1. - 4.21.8.

4.21.1.  
Connect a piece of wire from TP31 (AGC ON/OFF) to ground.

4.21.2.  
Mount a 4.7 Kohm potentiometer as shown below.

4.21.3.  
Mount a 560 ohm resistor to TP20 and TP21 and connect the voltmeter parallel to the resistor by means of a screened cable.

4. PERFORMANCE CHECK cont.:

4.21.4.

Connect the signal generator to the antenna input terminal and check that RF-filter sections covering the range 1.6 - 3.8 MHz is strapped for low impedance.

4.21.5.

Choose  $f_{RX}$ ,  $f_G$  and  $V_G$  according to table 4.21.9.

4.21.6.

Adjust the mounted trimming potentiometer to achieve a meter reading of 0 dB in the 1V range.

4.21.7.

Remove the signal from the antenna input terminal and notice the drop in meter reading.

In any case this must be at least 20 dB.

4.21.8.

Remove the 4.7 kohm trimming potentiometer and the 560 ohm resistor mounted as described in 4.21.2. and 4.21.3.

Table 4.21.9.

R1121 B6/7

4.22.

CHECK OF INTERFACE UNIT

4.22.1.

Execute 4.6. and 4.21.

4.22.2.

Connect oscilloscope to TP32 through passive probe.

4.22.3.

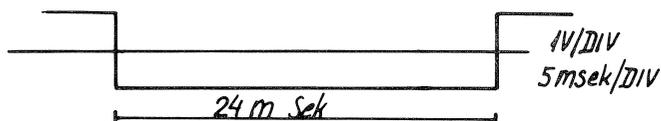

Select exciter frequency  $f_{TX} = 7000$  kHz.

4. PERFORMANCE CHECK cont.:

4.22.4.

Check that the signal in TP32 is as shown below.

**NOTE!** The signal on TP is only present when the exciter frequency information is transmitted from R1121 to the exciter.

4.22.5.

Connect oscilloscope to TP33 through passive probe.

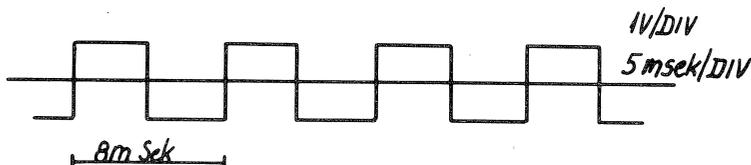

4.22.6.

Execute 4.22.3.

4.22.7.

Check that the signal on TP33 is as shown below.

**NOTE!** The signal on TP is only present when the exciter frequency information is transmitted from R1121 to the exciter.

R1121 B7/7

## 5. ADJUSTMENT PROCEDURE FOR R1121

**NOTE!** The trimming cores are factory sealed. Use normal cellulose thinner to break the seal.

### 5.1. DEFINITIONS USED

5.1.1.  $f_{RX}$  = frequency to which the receiver is adjusted.

$f_G$  = signal generator frequency, i.e. the input frequency to the receiver.

$V_G$  = EMF of signal generator with proper generator impedance.

$f_{AF}$  = Audio frequency to AF to telex and loudspeaker.

### 5.2. ADJUSTMENT OF +18V SUPPLY UNIT

5.2.1. Connect the voltmeter to TP1.

5.2.2. Adjust R1110 to -18V  $\pm 0.2V$ .

5.2.3. Connect the voltmeter to TP2.

5.2.4. Adjust R1114 to 018V  $\pm 0.2$  Volt.

### 5.3. ADJUSTMENT OF TCXO

5.3.1. The receiver must be ON for at least 5 minutes.

5.3.2. Connect the counter to TP3.

5.3.3. Adjust R1013 to 10 000 000 Hz.

### 5.4. ADJUSTMENT OF CLARIFIER OSC.

5.4.1. Connect the counter to TP4.

5.4.2. Select  $f_{RX}$  = 2000 kHz.

5.4.3. Adjust L1701 to 9000 Hz.

### 5.5. ADJUSTMENT OF 600 kHz GENERATOR

5.5.1. Connect the diode probe to TP5.

5.5.2. Adjust L1002 for max. voltage (approx. 1V).

### 5.6. ADJUSTMENT OF 16 MHz GENERATOR

5.6.1. Select  $f_{RX}$  = 2000 kHz.

5.6.2. Connect the diode probe to TP4.

5.6.3. Adjust L1001 to max. voltage (approx. 2V).

### 5.7. ADJUSTMENT OF IF AMPLIFIER DETECTOR

5.7.1. Connect the signal generator to TP7 through a 10 nF capacitor and set the signal generator to  $f_G$  = 598.3 kHz and  $V_G$  = 10 mV.

5.7.2. Slowly reduce  $V_G$  until noise starts to dim the AF-tone, then increase  $V_G$  20 dB.

5.7.3. Connect the voltmeter to TP22 by means of a screened cable, and adjust AF-gain until the meter reads 0 dB in the 1V range.

## 5. ADJUSTMENT PROCEDURE cont.:

### 5.7.4.

Adjust L805 for max. meter reading and readjust contemporary AF-gain control to maintain a meter reading of 0 dB.

### 5.7.5.

Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of approx. 1.0V.

### 5.7.6.

Adjust L801 for maximum meter reading, and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

## 5.8.

### ADJUSTMENT OF IF FILTER

#### 5.8.1.

Connect the signal generator to TP7 through a 10 nF capacitor and set the signal generator to  $f_G = 598.3$  kHz and  $V_G$  10 mV.

#### 5.8.2.

Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of approx. 1.0 Volt.

#### 5.8.3.

Adjust L707 for maximum meter reading, and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

## 5.9.

### ADJUSTMENT OF FIRST AND SECOND MIXER

#### 5.9.1.

Connect the voltmeter to TP19.

#### 5.9.2.

Select  $f_{RX} = 10$  kHz and adjust R506 for min. meter reading, and for min. noise coming from loudspeaker.

#### 5.9.3.

Connect the signal generator to TP9 and set  $f_G = 16607.3$  kHz

#### 5.9.4.

Select  $f_{RX} = 10$  MHz.

### 5.9.5.

Adjust  $V_G$  to achieve approx. 1.0V on TP19.

### 5.9.6.

Adjust C512 and L503 for maximum meter reading and readjust contemporary  $V_G$  to maintain approx. 1.0V.

### 5.9.7.

Set  $f_G = 10607.3$  kHz and select  $f_{RX} = 20$  MHz.

### 5.9.8.

Adjust  $V_G$  to achieve approx. 1.0V on TP19.

### 5.9.9.

Adjust C511 and L501 for maximum meter reading and readjust contemporary  $V_G$  to maintain approx. 1.0V.

## 5.10.

### ADJUSTMENT OF 4 MHz RF-FILTER

#### 5.10.1.

Turn the core of each filter coil almost out of the coil former to avoid that the cores are of importance to the coil inductance.

#### 5.10.2.

Connect the signal generator to the antenna input terminal.

#### 5.10.3.

Select  $f_{RX} = 4280$  kHz.

#### 5.10.4.

Set the signal generator to  $f_G = 4281.7$  kHz.

#### 5.10.5.

Connect the voltmeter to TP19 and readjust  $V_G$  to achieve a meter reading of approx. 1.0V.

#### 5.10.6.

Adjust L203 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.10.7.

Adjust L201 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

## 5. ADJUSTMENT PROCEDURE cont.:

### 5.10.8.

Adjust L202 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.11.

#### ADJUSTMENT OF 6 MHz RF-FILTER

#### 5.11.1.

Turn the core of each filter coil almost out of the coil former to avoid that the cores are of importance to the coil inductance.

#### 5.11.2.

Connect the signal generator to the antenna input terminal.

#### 5.11.3.

Select  $f_{RX} = 6410$  kHz.

#### 5.11.4.

Set the signal generator to  $f_G = 6411.7$  kHz.

#### 5.11.5.

Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of 1.0V.

#### 5.11.6.

Adjust L303 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.11.7.

Adjust L301 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.11.8.

Adjust L302 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.12.

#### ADJUSTMENT OF 8 MHz RF-FILTER

#### 5.12.1.

Turn the core of each filter coil almost out of the coil former to avoid that the cores are of importance to the coil inductance.

#### 5.12.2.

Connect the signal generator to the antenna input terminal.

#### 5.12.3.

Select  $f_{RX} = 8570$  kHz.

#### 5.12.4.

Set the signal generator to  $f_G = 8571.7$  kHz.

#### 5.12.5.

Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of approx. 1.0V.

#### 5.12.6.

Adjust L403 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.12.7.

Adjust L401 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.12.8.

Adjust L402 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.13.

#### ADJUSTMENT OF 12 MHz RF-FILTER

#### 5.13.1.

Turn the core of each filter coil almost out of the coil former to avoid that the cores are of importance to the coil inductance.

#### 5.13.2.

Connect the signal generator to the antenna input terminal.

#### 5.13.3.

Select  $f_{RX} = 12880$  kHz.

#### 5.13.4.

Set the signal generator to  $f_G = 12881.7$  kHz.

#### 5.13.5.

Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of 1.0V.

## 5. ADJUSTMENT PROCEDURE cont.:

### 5.13.6.

Adjust L404 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.13.7.

Adjust L406 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.13.8.

Adjust L405 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.14.

#### ADJUSTMENT OF 16 MHz RF-FILTER

#### 5.14.1.

Turn the core of each filter coil almost out of the coil former to avoid that the cores are of importance to the coil inductance.

#### 5.14.2.

Connect the signal generator to the antenna input terminal.

#### 5.14.3.

Select  $f_{RX} = 17000$  kHz.

#### 5.14.4.

Set the signal generator to  $f_G = 17001.7$  kHz.

#### 5.14.5.

Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of approx. 1.0V.

#### 5.14.6.

Adjust L304 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.14.7.

Adjust L306 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.14.8.

Adjust L305 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.15.

#### ADJUSTMENT OF 22 MHz RF-FILTER

#### 5.15.1.

Turn the core of each filter coil almost out of the coil former to avoid that the cores are of importance to the coil inductance.

#### 5.15.2.

Connect the signal generator to the antenna input terminal.

#### 5.15.3.

Select  $f_{RX} = 22460$  kHz.

#### 5.15.4.

Set the signal generator to  $f_G = 22461.7$  kHz.

#### 5.15.5.

Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of approx. 1.0V.

#### 5.15.6.

Adjust L204 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.15.7.

Adjust L206 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

#### 5.15.8.

Adjust L205 for maximum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

### 5.16.

#### ADJUSTMENT OF 16.6 MHz NOTCH FILTER

#### 5.16.1.

Connect the signal generator to the antenna input terminal.

#### 5.16.2.

Select  $f_{RX} = 2$  MHz.

#### 5.16.3.

Set the signal generator to  $f_G = 16.6073$  MHz.

5. ADJUSTMENT PROCEDURE cont.:

5.16.4.  
Connect the voltmeter to TP19 and adjust  $V_G$  to achieve a meter reading of approx. 1.0V.

5.16.5.  
Adjust L2001 for minimum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

5.16.6.  
Adjust R2002 for minimum meter reading and readjust contemporary  $V_G$  to maintain the meter reading of 1.0V.

5.17.  
ADJUSTMENT OF HARMONIC FILTERS

5.17.1.  
Load the harmonic filters with 68 ohm.

5.17.2.  
Connect the voltmeter to TP11.

5.17.3.  
Turn the core of each coil to the level of the coil former.

5.17.4.  
Select  $f_{RX}$  as specified in table 5.17.11.

5.17.5.  
The harmonic filters are adjusted by turning the core of the selected coil until the voltage reaches the value of 15V  $\pm$ 1V.

5.17.6.  
Connect the voltmeter to TP24.

5.17.7.  
Execute 5.17.4. and adjust each selected coil to minimum voltage. This voltage must be 2.0V  $\pm$ 1V.

5.17.8.  
Connect the voltmeter to TP11.

5.17.9.  
Execute 5.17.4. and check the voltage to be 15V  $\pm$ 1V.

5.17.10.  
Disconnect the 68 ohm load.

5.17.11.

$f_{RX}$ (MHz)	Selected harmonic filter (MHz)
1.999	14
3.999	16
5.999	18
7.999	20
9.999	22
11.999	24
13.999	26

R1121 B5/5

## 6. NECESSARY ADJUSTMENTS AFTER REPAIR FOR R1121

In the following paragraphs reference is made to the ADJUSTMENT PROCEDURE FOR R1121 and PERFORMANCE CHECK FOR R1121.

Definitions used: refer to 5.1.

Locations: refer to ADJUSTMENT LOCATIONS.

6.1.  
Module No. 100: AERIAL SWITCH

6.1.1.  
Execute 4.20.

6.1.2.  
Execute 4.21.

6.2.  
Module No. 200: RF-FILTER 4 MHz SECTION

6.2.1.  
Execute 5.10.

6.2.2.  
Execute 4.21. for the filter section in question.

6.3.  
Module No. 200: RF-FILTER 22 MHz SECTION

6.3.1.  
Execute 5.15.

6.3.2.  
Execute 4.21. for the filter section in question.

6.4.  
Module No. 300: RF-FILTER 6 MHz SECTION

6.4.1.  
Execute 5.11.

6.4.2.  
Execute 4.21. for the filter section in question.

6.5.  
Module No. 300: RF-FILTER 16 MHz SECTION

6.5.1.  
Execute 5.14.

6.5.2.  
Execute 4.21. for the filter section in question.

6.6.  
Module No. 400: RF-FILTER 8 MHz SECTION

6.6.1.  
Execute 5.12.

6.6.2.  
Execute 4.21. for the filter section in question.

6.7.  
Module No. 400: RF-FILTER 12 MHz SECTION

6.7.1.  
Execute 5.13.

6.7.2.  
Execute 4.21. for the filter section in question.

6.8.  
Module No. 1900: RF-FILTER 1.6-2.0 MHz & 2.0-2.5 MHz SECTION

6.8.1.  
Execute 4.21. for the filter section in question.

6.9.  
Module No. 1100: RF-FILTER 2.5-3.1 MHz & 3.1-3.8 MHz SECTION

6.9.1.  
Execute 4.21. for the filter section in question.

6. NECESSARY ADJUSTMENTS AFTER REPAIR cont.:

6.10.  
Module No. 2000: 16.6 MHz NOTCH FILTER

6.10.1.  
Execute 5.16.

6.10.2.  
Execute 4.21. for the following filter sections: 12 MHz, 1.6-2.0 MHz & 2.02.5 MHz and 2.5-3.1 MHz & 3.1-3.8 MHz.

6.11.  
Module No. 500: 1st & 2nd MIXER

6.11.1.  
Execute 5.9. and 4.15.

6.11.2.  
Execute 4.21. for  $f_{RX} = 4280$  kHz.

6.12.  
Module No. 600: IF FILTER

6.12.1.  
Execute 5.8.

6.12.2.  
Execute 4.21. for  $f_{RX} = 4280$  kHz.

6.13.  
Module No. 800: IF-AMPLIFIER, AGC AND DETECTOR

6.13.1.  
Execute 5.7., 4.17. and 4.18.

6.13.2.  
Execute 4.21. for  $f_{RX} = 4280$  kHz.

6.14.  
Module No. 900: AUDIO AMPLIFIER

6.14.1.  
Execute 4.18. and 4.19.

6.15.  
Module No. 1000: DIVIDER UNIT

6.15.1.  
Execute 4.3., 5.3., 5.5., 5.6., 4.10., 4.11. and 4.21.

6.16.  
Module No. 1100: LOOP 1 FILTER AND +18V SUPPLY UNIT

6.16.1.  
Execute 5.2., 4.5. with  $f_{RX}=10$  MHz, 4.10. and 4.16.

6.17.  
Module No. 1200: VCO-UNIT

6.17.1.  
Execute 4.6., 4.10. and 4.15.

6.18.  
Module No. 1300: HARMONIC FILTER UNIT

6.18.1.  
Execute 5.17.

6.19.  
Module No. 1400: LOOP 1 MIXER UNIT

6.19.1.  
Execute 4.6., 4.16. and 4.10.

6.20.  
Module No. 1500: VCO BUFFER UNIT

6.20.1.  
Execute 4.15.

6.21.  
Module No. 1600: VCXO 1st LOOP 2 MIXER AND LOOP 2 FILTER

6.21.1.  
Execute 4.7.1. - 4.7.3., 4.8., 4.11. and 4.15.

## 6. NECESSARY ADJUSTMENTS AFTER REPAIR cont.:

6.22.

Module No. 1700: CLARIFIER AND 2nd LOOP 2 MIXER

6.22.1.

Execute 5.4. and 4.7.

6.23.

Module No. 2100: VCO-SELECTOR

6.23.1.

Execute 4.6.

6.23.2.

Execute 4.21. for  $f_{RX} = 4280$  kHz  
and  $f_{RX} = 17000$  kHz.

6.24.

Module No. 2200: INTERFACE

6.24.1.

Execute 4.22.

## 7. FUNCTION CHECK

7.1.

Connect a signal generator to the antenna input terminal.

7.2.

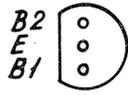

Select  $f_{RX}$ ,  $f_G$  and  $V_G$  according to table 7.3., and check in each case that a 1700 Hz tone is heard in the loudspeaker.

7.3.

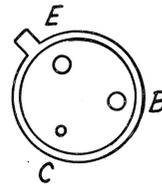

$f_{RX}$ (kHz)	$f_G, V_G$
1800	
2250	
2800	
3450	
4280	$f_{RX} + 1700$ Hz
6410	
8570	$V_G = 1mV$ 60 dB/1uV
12880	
17000	
22460

CIRCUIT DESCRIPTION AND SCHEMATIC DIAGRAMS

## CIRCUIT DESCRIPTION AERIAL SWITCH R1121

The aerial switch unit selects the proper front-end filter and leads the aerial signal to this. The aerial signal is switched by the relays RE102-RE117 and the actual front-end filter is selected by the relay driver transistors T101-T116. These transistors are turned on by the 4 to 16 line decoder IC101, which turns low the output indicated by the 4-bit code on the inputs (A, B, C, D).

The 4-bit code is generated on the interface unit and fed to IC101 via the level shift transistors T122-T126.

The aerial switch unit also takes care of the receiver blocking. A fast blocking is obtained by the RX BLOCK input, which turned low will short-circuit the aerial signal to ground by means of T117 and RE101. Additionally, a mixer block signal is generated via T120 and T121. Another and slower blocking is obtained by the input SIMPLEX RELAY, which via T119, T118 and RE118 short-circuits the aerial signal to ground.

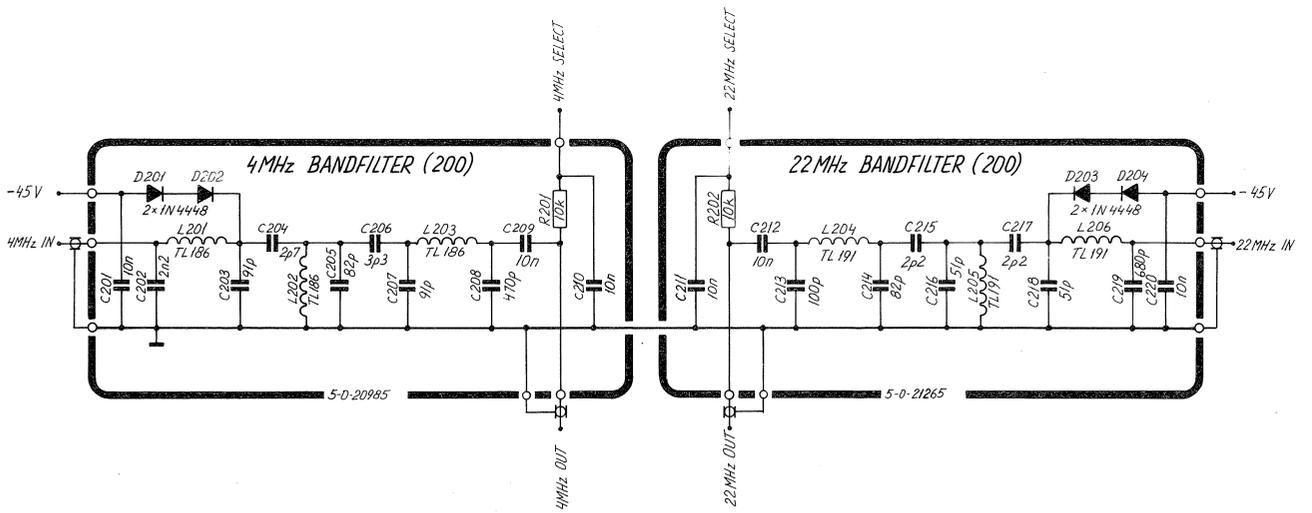

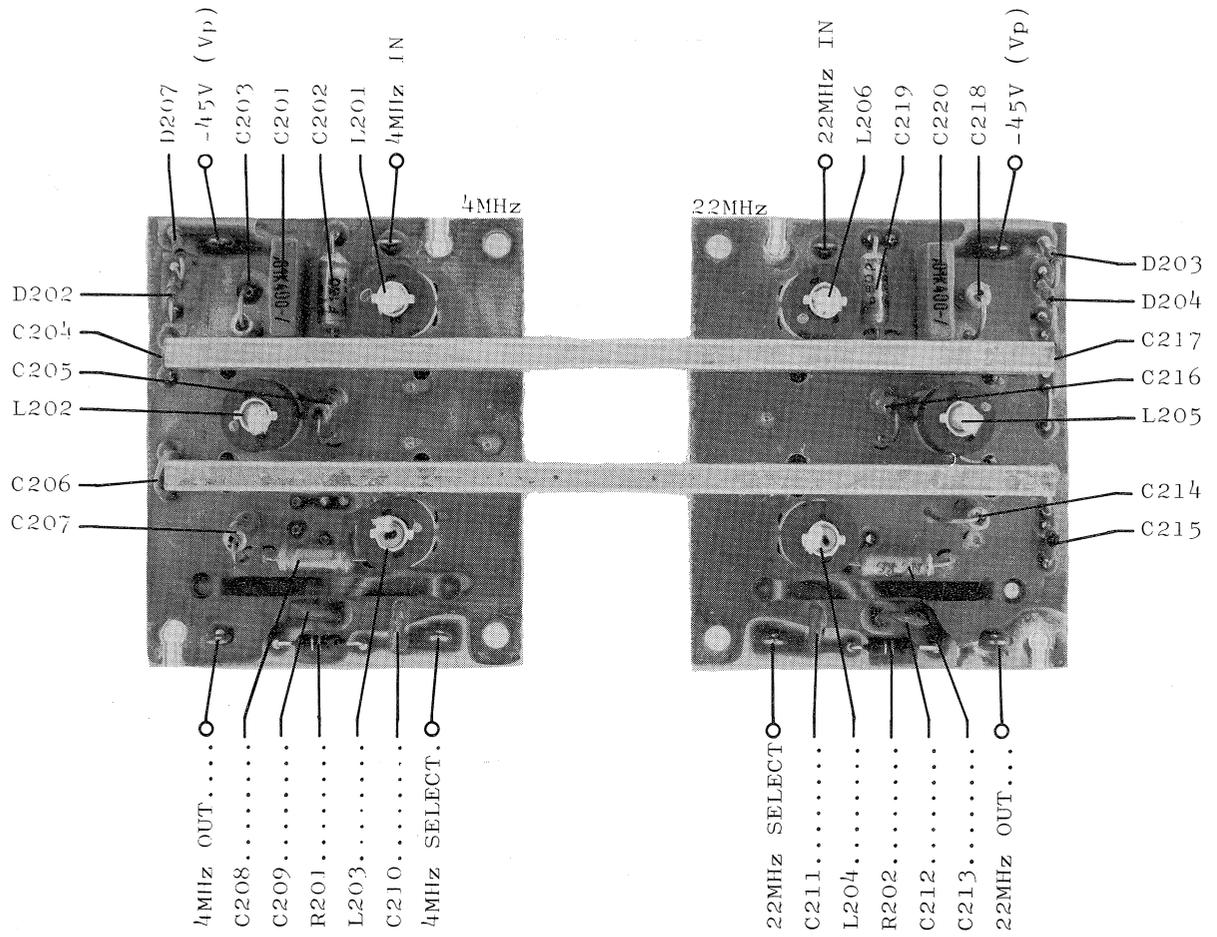

## CIRCUIT DESCRIPTION RF FILTERS 4 AND 22 MHZ

The RF filters in R1121 are divided into eight different filter sections namely:

1.6-2.0 MHz & 2.0-2.5 MHz, 2.5-3.1 MHz & 3.1-3.8 MHz, 4 MHz, 6 MHz, 8 MHz, 12 MHz, 16 MHz and 22 MHz. All filters are fixed bandpass filters.

**4 MHz Section:** The filter is designed with 3 LC-resonant circuits L201/C202/C203, L202/C205 and L203/C207/C208 which are connected through the capacitor coupling C204 and C206. The two reverse biased diodes D201, D202 and the capacitor C201 form together with R101, located on the aerial switch PCB, the aerial protection circuit. The output signal from the filter is led directly to the mixer (module 500).

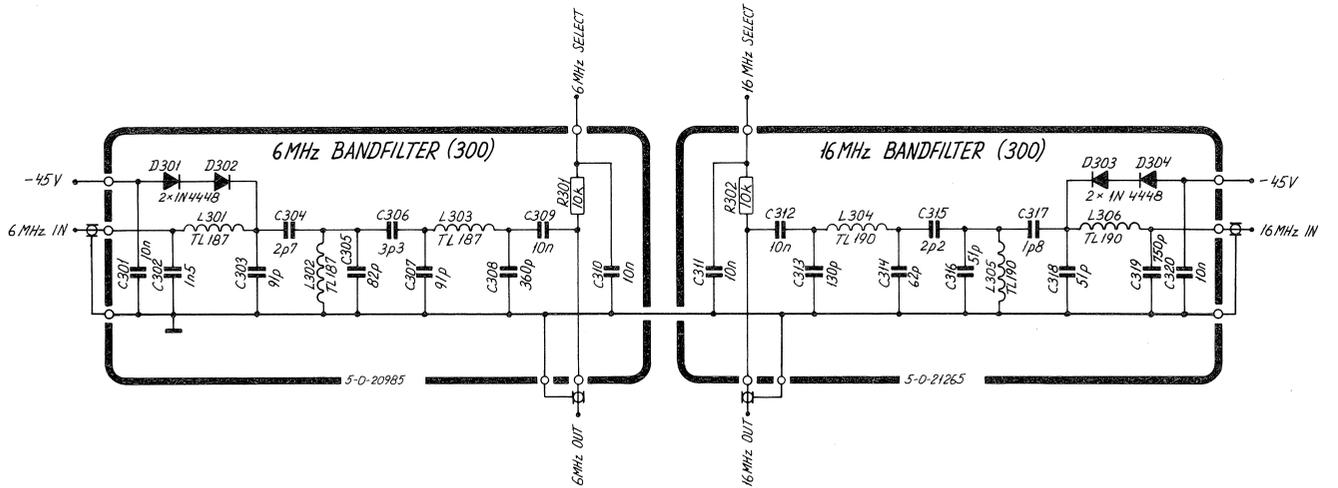

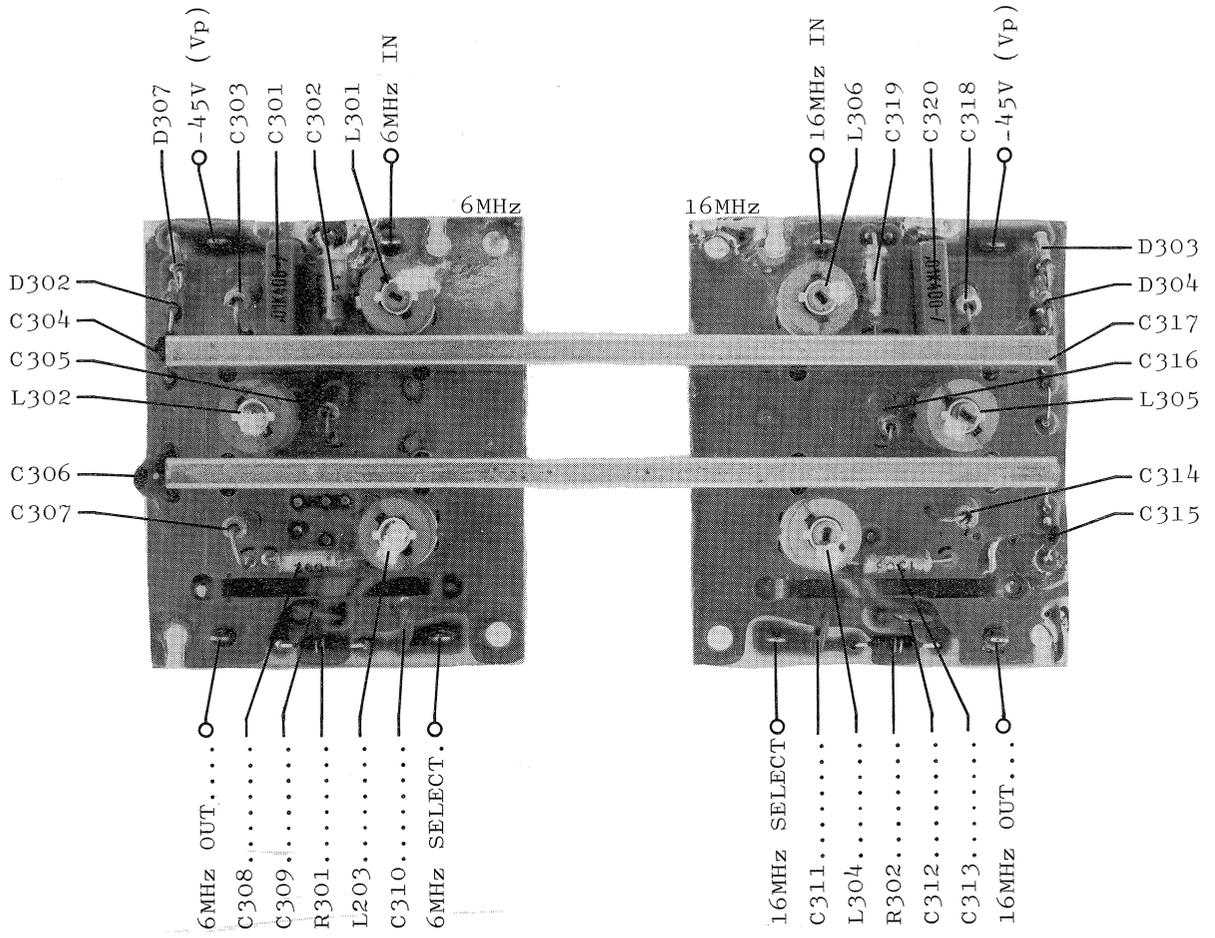

**22 MHz Section:** The filter is designed with 3 LC-resonant circuits L206/C219/C218, L205/C216 and L204/C214/C213 which are connected through the capacitor coupling C217 and C215. The two reverse biased diodes D203, D204 and the capacitor C220 form together with R101, located on the aerial switch PCB, the aerial protection circuit. The output signal from the filter is led directly to the mixer (module 500).

## CIRCUIT DESCRIPTION RF FILTERS 6 AND 16 MHz

**6 MHz Section:** The filter is designed with 3 LC-resonant circuits L301/C302/C303, L302/C305 and L303/C307/C308 which are connected through the capacitor coupling C304 and C306. The two reverse biased diodes D301, D303 and the capacitor C301 form together with R101, located on the aerial switch PCB, the aerial protection circuit. The output signal from the filter is led directly to the mixer (module 500).

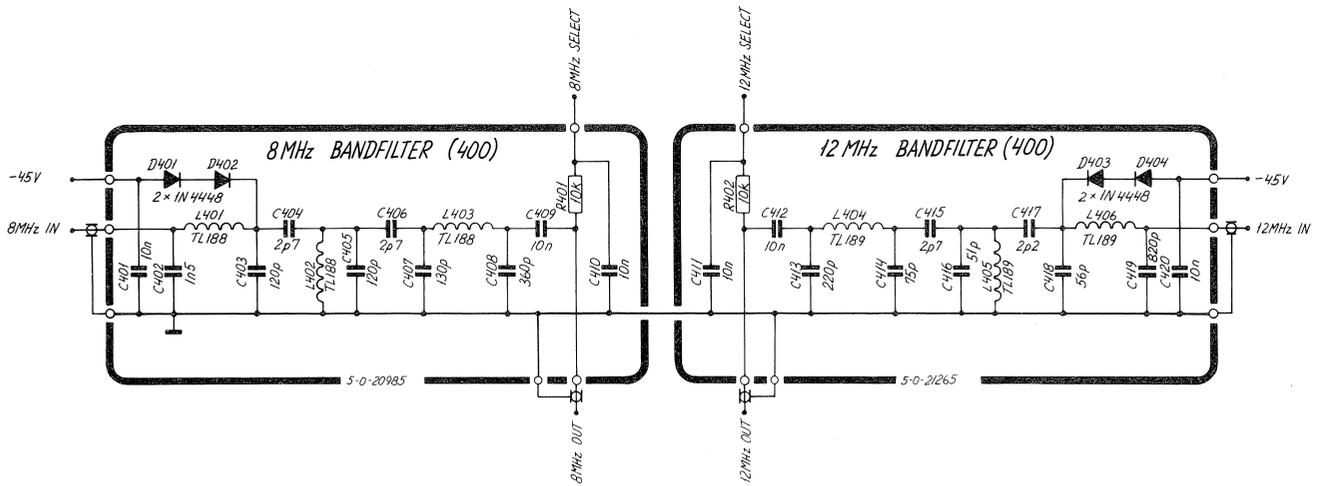

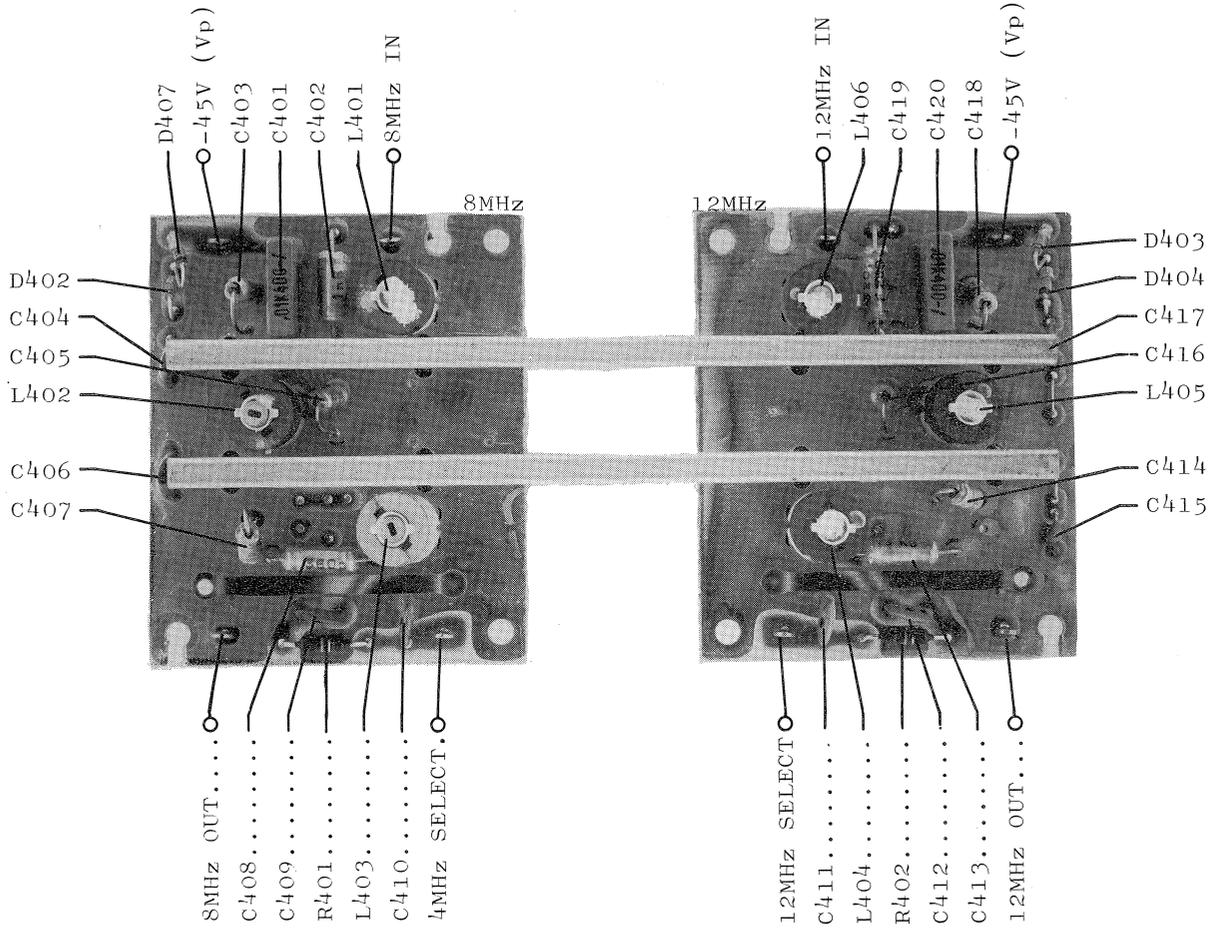

**16 MHz Section:** The filter is designed with 3 LC-resonant circuits L306/C319/C318, L305/C316 and L304/C314/C313 which are connected through the capacitor coupling C317 and C315. The two reverse biased diodes D303, D304 and the capacitor C320 form together with R101, located on the aerial switch PCB, the aerial protection circuit. The output signal from the filter is led directly to the mixer (module 500).

## CIRCUIT DESCRIPTION RF FILTERS 8 AND 12 MHz

**8 MHz Section:** The filter is designed with 3 LC-resonant circuits L401/C402/C403, L402/C405 and L403/C407/C408 which are connected through the capacitor coupling C404 and C406. The two reverse biased diodes D401, D402 and the capacitor C401 form together with R101, located on the aerial switch PCB, the aerial protection circuit. The output signal from the filter is led directly to the mixer (module 500).

**12 MHz Section:** The filter is designed with 3 LC-resonant circuits L406/C419/C418, L405/C416 and L404/C414/C413 which are connected through the capacitor coupling C417 and C415. The two reverse biased diodes D403, D404 and the capacitor C420 form together with R101, located on the aerial switch PCB, the aerial protection circuit. The output signal from the 12 MHz filter section is led to the 16.6 MHz Notch filter (module 2000) and through that into the mixer (module 500).

## CIRCUIT DESCRIPTION 1ST & 2ND MIXER R1119, R1120 & R1121

This unit contains the aerial input switching diodes, the first mixer, the first IF selectivity and the second mixer.

### 1st MIXER

From the band filters, the signal is fed to the balanced transformer TR501 and led to the balanced FET mixer T501 and T502. The first local oscillator signal from the VCO buffer is fed into the sources of the FET's. The difference frequency at the drains of the FET's is filtered out in the tuned circuits either TR502 and C512 for receiver frequency settings below 14 MHz, or TR502 and C508 and C511 for frequency settings above 14 MHz.

### 1st IF SELECTIVITY

For receiver frequency settings below 14 MHz, the tuned transformer TR501 ensures a proper generator impedance for the monolithic crystal filter FL502. The center frequency of the filter is 16.6085 MHz. The tuned circuit L503 and C519 ensures proper load impedance for the filter FL502 and proper generator impedance for the second mixer M501.

For receiver frequency settings above 14 MHz the tuned transformer ensures a proper generator impedance for the monolithic crystal filter FL501, the center frequency of which is 10.6085 MHz. The tuned circuit L502 and C518 ensures proper load impedance for the filter FL501 and proper generator impedance for the second mixer M501.

The switching between the two IF's takes place by means of either R515, D513, R520, R514, R511 and D510 or R517, D514, R520, R513, R512 and D511.

### 2nd MIXER

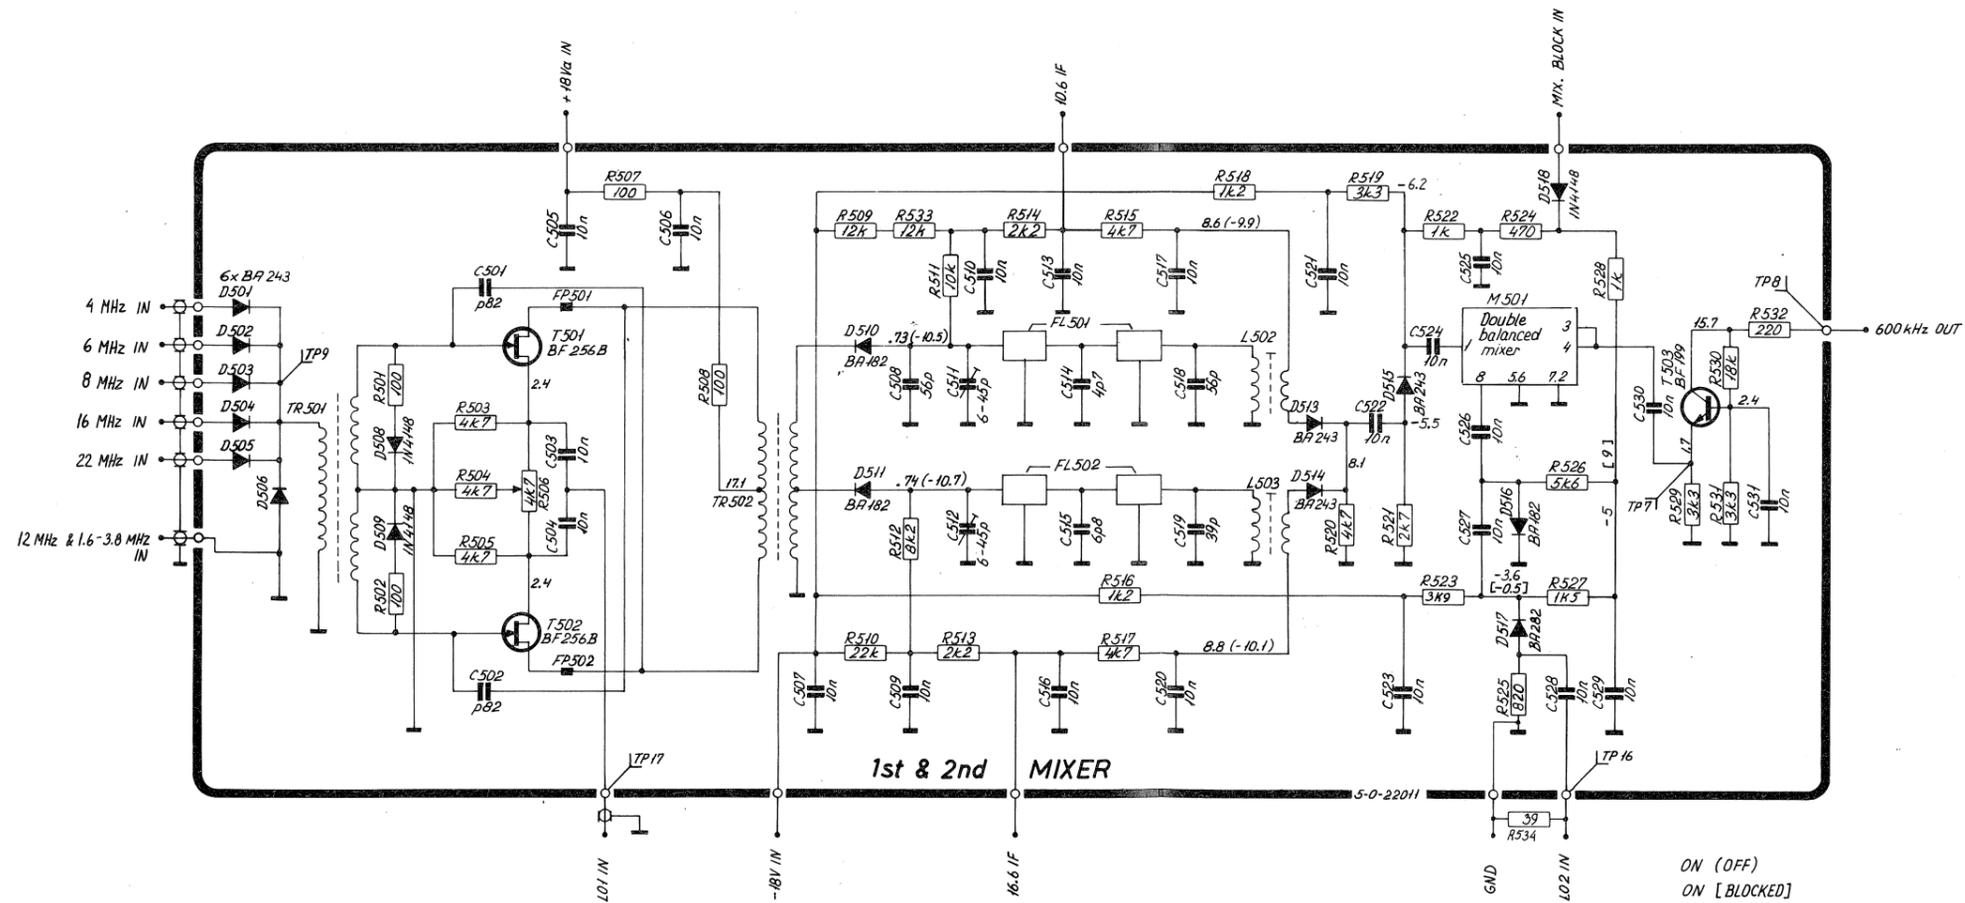

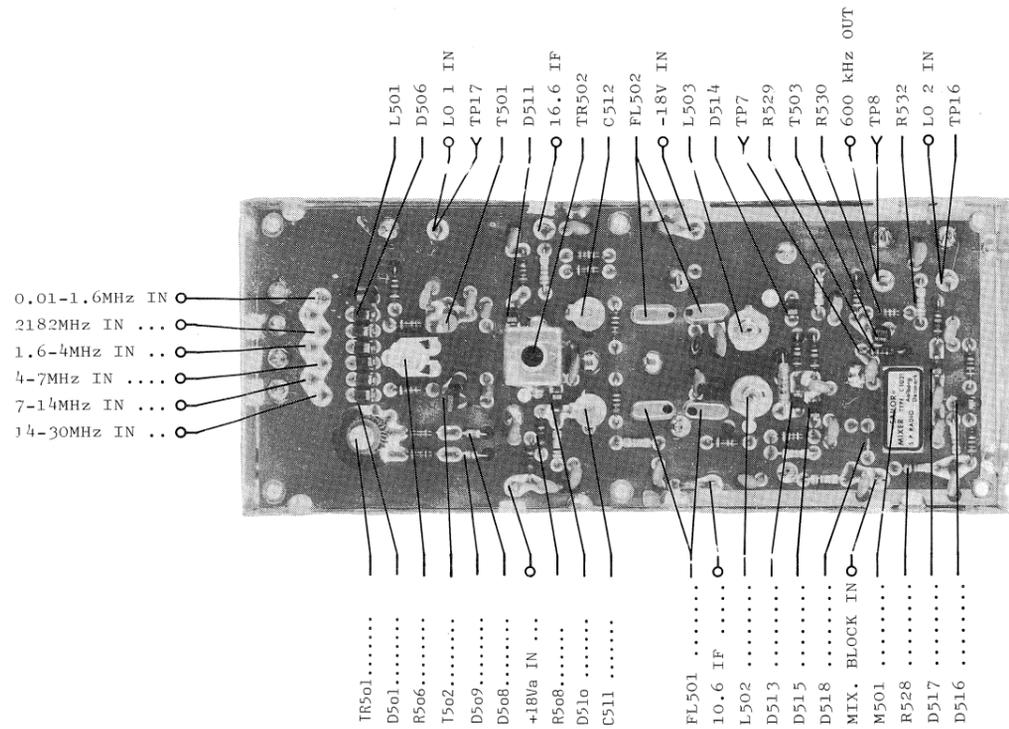

From the coil L502/L503 the signal is fed to the input port of the balanced diode mixer M501. The second local oscillator signal from the VCX0 1st Loop 2 mixer and Loop 2 filter is fed to the L0 port of the mixer.

From the output port of the mixer the signal is led to the common base buffer amplifier T503. The difference frequency at the collector of T503 is filtered out in the IF filters.

The remaining components D518, R524, R522, D515, R521, R528, R526, D516, R525, D517 and R525 is the mixer blocking circuit, which secures that no energy is stored in the IF-filters when the receiver is blocked.

TEST CONDITIONS

Frequency Setting: 2.0005 MHz  
 Oscilloscope Input: Passive probe 10:1  
 DC Voltmeter Input: 10 Mohm  
 ● : Diode probe measurement  
 TP: Testpoint  
 All voltage statements are typical

## CIRCUIT DESCRIPTION FOR IF FILTER R1121

This unit contains IF selectivity together with external switching circuitry for an optional IF filter.

The high order telex filter ensures the necessary adjacent channel selectivity and far away spurious attenuation.

The switching in and out takes place by means of switch diodes D704 and D703.

The telex filter output signal is fed into a 600 kHz tuned amplifier stage T703. The tuned circuit of the amplifier is located on the IF Amp, Detector and AGC PCB.

## CIRCUIT DESCRIPTION OF IF AMPLIFIER, DETECTOR AND AGC R1119, R1120 & R1121

This unit contains the 600 kHz IF amplifier, the AM and SSB detector and the AM and SSB AGC system.

### IF AMPLIFIER

The IF signal from the IF filters enters the 600 kHz tuned circuit L801, C802 and C803. From a tap on L801 the signal is fed to the gate of T804 where it is amplified. The load of T804 consists of a 600 kHz fixed tuned circuit L802, C810 and C811.

From the drain of T804 the signal is fed to the gate of T808. The load of T808 consists of a 600 kHz fixed tuned circuit L803, C818 and C819. The diodes D805 and D806 are amplitude limiters to protect T814.

From the drain of T808 the signal is fed to the base of the untuned amplifier T814. From the collector of T814 the signal is fed to the base of the tuned amplifier T817D. The tuned circuit consists of L805, C834 and C837.

The stabistors D814 and D815 are amplitude limiters to limit the output in the AGC OFF mode.

### DETECTOR

From L805 the signal is fed to the bases of T817A and T817B, which are an envelope transistor detector suitable for AM signals.

In the SSB mode a carrier reinjection signal is added to the IF signal via T817C and L805 in such a way that the modulation percent is kept low, approx. 11% in the resulting A3H signal to ensure low detector distortion.

### R1120 only:

In the A1 mode the BFO signal is added to the IF-signal instead of the fixed 600 kHz carrier reinjection signal.

### AGC SYSTEM

The control of the IF amplification is carried out by negative feed-back and decreasing of the load impedance of the three tuned amplifier stages by means of the transistors T801, T806 and T809, i.e. increasing current means decreasing gain. The AGC voltage is fed to T801, T806 and T809 from C813 via the amplifier consisting of T803 and T805.

### A3H (AM) MODE

The information to the AGC system is taken at the emitter of T817D and fed to the emitter follower T813 via C825 to a peak detector consisting of D808 and T812.

T812 acts as a DC amplifier with a ripple filter R835 and C820. The signal is then fed to another emitter follower T810. The signal from T811 is grounded through R826. From T810 the signal is fed to the capacitor C813, thus feeding the AGC voltage to transistor T805. C813 is discharged through R820 and R827 which in A3H mode is grounded.

The discharge path through R841 is off because T815 is off.

**CIRCUIT DESCRIPTION OF IF AMPLIFIER, DETECTOR AND AGC R1119, R1120 & R1121**  
cont.

**A3J (SSB) MODE**

Charge of C813 and C816.

As in the A3H mode, the signal is taken at the emitter of T817D and passed through T813, T812 and R835 to the transistors T811 and T810. Transistor T811 is charging C816 through R826, and T810 is charging C813 through R820. C816 is charged very fast to the AGC voltage, but because of the voltage divider R826 and R824 the voltage on C813 is taking over after a while, meaning that in the steady state condition the AGC voltage is the voltage on C813.

At the same time C832 is charged to 4.2V via T807 and R828, giving a reference voltage for the hang AGC system. When the voltage on C828 is above 1.2V, transistor T816 is on and T815 is off, meaning that the discharge path of C813 through R841 is off.

When the IF signal disappears the only discharge path of C813 is via the base of T805 as T815 is off. C832 is now discharged through R865, T816 and D810. When the voltage across C832 is so low that T816 goes off, T815 goes on and C813 is discharged through R841.

When the AGC switch is in telex mode, R827 is grounded and C813 is discharged through R820 and R827 when the IF signal disappears.

Remaining functions of the unit:

The transistor T802 is the emitter follower for the AGC meter.

The AGC ON/OFF function is performed by grounding the base of T810 and T811.

The MGC function is performed by means of the voltage divider R801, R802, R2604 (RF-GAIN) R2603 and R803.

## CIRCUIT DESCRIPTION AUDIO AMPLIFIER R1119, R1120 & R1121

This unit contains the AF-preamplifier, the active lowpass filter, the 0 dBm fixed AF output amplifier and the AF power amplifier.

### AF PREAMPLIFIER AND LOWPASS FILTER

The AF signal from the detector is amplified in the operational amplifier IC901d and fed to the fifth order active LP filter with a cut-off frequency of 2.9 kHz. The active filter is built-up around the operational amplifiers IC901c and IC901b. The signal is then fed to the 0 dBm fixed AF output amplifier IC901a, the output from which enters the output transformer L2502 located on the input filter circuit board.

### AF POWER AMPLIFIER

From the output of the active filter, R921 the signal is fed to the AF gain, R2607 and from there to the input of the power amplifier C914.

The integrated power amplifier IC902 has two built-in protection facilities, namely output current limiter and thermal shut-down, which means that the power amplifier cannot be destroyed by overload.

From the output terminal, pin 12, the signal is fed to the loudspeaker and the voltage divider for headphones output, J2602.

## CIRCUIT DESCRIPTION FOR DIVIDER UNIT R1119, R1120 & R1121

This unit contains the logic part of phase locked Loop 1 and phase locked Loop 2.

The 10 MHz reference oscillator (TCX0), reference divider, 2 MHz spectrum generator, 600 kHz carrier generator, programmable dividers for Loop 1 and Loop 2, the phase/frequency detectors for Loop 1 and Loop 2 and the 10/16 MHz output for the VCX0 1st Loop 2 mixer and Loop 2 filter.

### 10 MHz REFERENCE

The frequency stability of the receiver is related to the 10 MHz TCX0 X01001. The 10 MHz reference signal is amplified in the transistors T1004 and T1005.

### REFERENCE DIVIDER

The counters IC1015, IC1011 and IC1007 divide the 10 MHz reference signal down to respectively  $f_{R1} = 1$  kHz and  $f_{R2} = 100$  Hz.

### 2 MHz HARMONIC SPECTRUM GENERATOR

With a repetition frequency of 2 MHz, the output  $Q_D$  of IC1015 goes low and the nand-gates in IC1014 will generate a narrow pulse due to the delay-time in the gates.

### 600 kHz GENERATOR

The output on IC1011, pin 5,  $Q_B$  has a high content of 600 kHz, which is amplified in the transistor T1006 and filtered in the tuned circuit L1002, C1021 and C1022.

### PROGRAMMABLE DIVIDER FOR LOOP 1

The variable frequency  $f_{T1}$  from Loop 1 mixer is amplified and shaped in T1001 and IC1009a. Independent of which 2 MHz band is used, the frequency  $f_{T1}$  will vary from 2699 kHz to 4698 kHz as the VCO varies 2 MHz. The programmable divider divides  $f_{T1}$  down to 1 kHz (dividing figure  $N_1$ ). This means that there are 2000 frequencies in each 2 MHz band. The frequency is controlled by the keyboard control, which encodes the start figure  $P_1$  into the BCD counters IC1001, IC1002, IC1003 and IC1004.

The stop figure  $S_1$  is controlled from the gates IC1008b and IC1009c. When the counter outputs  $Q_A$ ,  $Q_B$  ... etc. equal the stop figure  $S_1 + 2$  the J-K flip-flop IC1010b uses 2 clock pulses to load the start figure  $P_1$  into the counters IC1001, IC1002, IC1003 and IC1004. The counter counts down from the start figure  $P_1$  to stop figure  $S_1$  and thus the dividing figure  $N_1 = P_1 - S_1$ .

### LOOP 1 PHASE/FREQUENCY DETECTOR

The reference frequency  $f_{R1} = 1$  kHz and the variable frequency  $f_{V1} = 1$  kHz are fed into the phase/frequency detector IC1006. The phase/frequency detector IC1006 generates an error voltage, which is proportional to frequency or phase difference between the two signals mentioned above. This error voltage is fed into the integrator on the Loop 1 filter &  $\pm 18V$  supply unit.

## CIRCUIT DESCRIPTION FOR DIVIDER UNIT R1119, R1120 & R1121 cont.

### PROGRAMMABLE DIVIDER FOR LOOP 2

The variable frequency  $f_{T2}$  from the Loop 2 mixer is amplified and shaped in T1002 and IC1009b. The frequency  $f_{T2}$  will vary between 7.85 kHz and 9.25 kHz depending on the 100 Hz programming. The programmable divider divides  $f_{T1}$  down to 100 Hz (dividing figure  $N_2$ ).

From the keyboard control the start figure  $P_2$  encodes into the BCD counter IC1005.

The stop figure  $S_2$  is controlled from the gate IC1008a. When the counter outputs  $Q_A$ ,  $Q_B$ ,  $Q_C$  ... etc. equal the stop figure  $S_2 - 2$ , the J-K flip-flop IC1010a uses 2 clock pulses to load the start figure  $P_2$  into the counters IC1005 and IC1012. The counter will count up from the start figure  $P_2$  to the stop figure  $S_2$ , and thus the dividing figure is  $N_2 = S_2 - P_2$ .

### LOOP 2 PHASE/FREQUENCY DETECTOR

The reference frequency  $f_{R2} = 100$  Hz and the variable frequency  $f_{V1} = 100$  Hz, are fed into the phase/frequency detector IC1013. The phase/frequency detector IC1013 generates an error voltage proportional to the frequency or the phase difference between the two signals mentioned above. This error voltage is fed into the integrator on the VCX0 1st Loop 2 mixer and Loop 2 filter.

### 10/16 MHz OUTPUT

The 10 MHz and the 16 MHz outputs are taken from the 10 MHz amplifier T1005 and the 16 MHz tuned amplifier T1003 respectively, and these are fed from pin 11 of the reference divider IC1015. This output has a high content of 16 MHz. The signals are added in the resistors R1027, R1025 and T1026 and fed to the VCX0 1st Loop 1 mixer & loop 2 filter.

## CIRCUIT DESCRIPTION LOOP 1 FILTER & $\pm 18V$ SUPPLY UNIT R1119, R1120 & R1121

This unit contains two regulated power supplies  $\pm 18V$  with fold-back current limiter, the complete integrator and filter for Loop 1.

### **-18V SUPPLY**

The series transistor T1103 supplies a -18V output controlled by the current flow into its base from T1105, where a portion of the output voltage, via a voltage divider containing R1110, is compared to a reference voltage created by R1103, D1102 and D1103. The fold-back is within the circuit. When the output current from the regulator increases, the base current must increase too, but this current is limited by R1103. When the regulator reaches this limit, T1105 stops conducting and so it folds back. To ensure that T1103 starts conducting, R1104 is added.

### **+18V SUPPLY**

The principle of operation for this regulator is exactly as described above, with an additional current limiter containing T1104 and T1106 to ensure the fold-back characteristic is maintained within design limits. To ensure startup, R1112 is added.

### **INTEGRATOR & LOOP 1 FILTER**

The integrator is built-up around IC1102, the integration capacitor is C1113. R1120 feeds current into the diode coupled Darlington pair in the phase comparator MC4044 on the divider board to perform the 1.5V reference. Output from the integrator pin 6 on IC1102 feeds into the active lowpass filter IC1101 to filter out the 1 kHz ripple from the phase comparator. The voltage divider R1118 and R1119 connected to IC1102 via D1106 ensure that the output voltage swing is within approx. -4V to -17V.

## CIRCUIT DESCRIPTION FOR VCO-UNIT R1119, R1120 & R1121

The VCO-unit comprises a common active negative resistance transistor-circuit and 12 parallel tuned circuits, which can be connected to the first mentioned circuit - one at a time - by means of diode switches. The negative resistance is generated by means of the feed-back around T1201 and T1202. When a parallel tuned circuit is connected to the collector of T1201 by means of a pair of band switching diodes D1226 to D1237 and D1238 to D1241, the circuit will oscillate. Each coil section will cover an output frequency range of 2 MHz.

The frequency of oscillation can be varied by means of the VCO-control input via the appropriate variocap. diode D1202 to D1213. The appropriate coil L1201 to L1212 is adjusted to give the maximum output frequency in the selected 2 MHz band for a control voltage of -15V. When the output frequency is varied 2.0 MHz for each coil section, the control voltage will change about 6 to 9.5V.

The AC amplitude level at the tuned circuit, and also at the buffer output port, is kept constant by means of an ALC-circuit. The output level is sensed at R1214 by the level detector C1211, R1216 and D1201. Via T1203 and R1201 the DC-current and so the gain in T1201 are regulated to give a constant output amplitude from the buffer amplifier built around T1204. The DC-level at the collector of T1203 will be able to vary between about 4.5V and 10.5V over the entire frequency range. The output level will be about 1.4V<sub>pp</sub> at C1212 and about 50 mV<sub>pp</sub> at the top of R1219.

VCO UNIT (MODULE 1200)

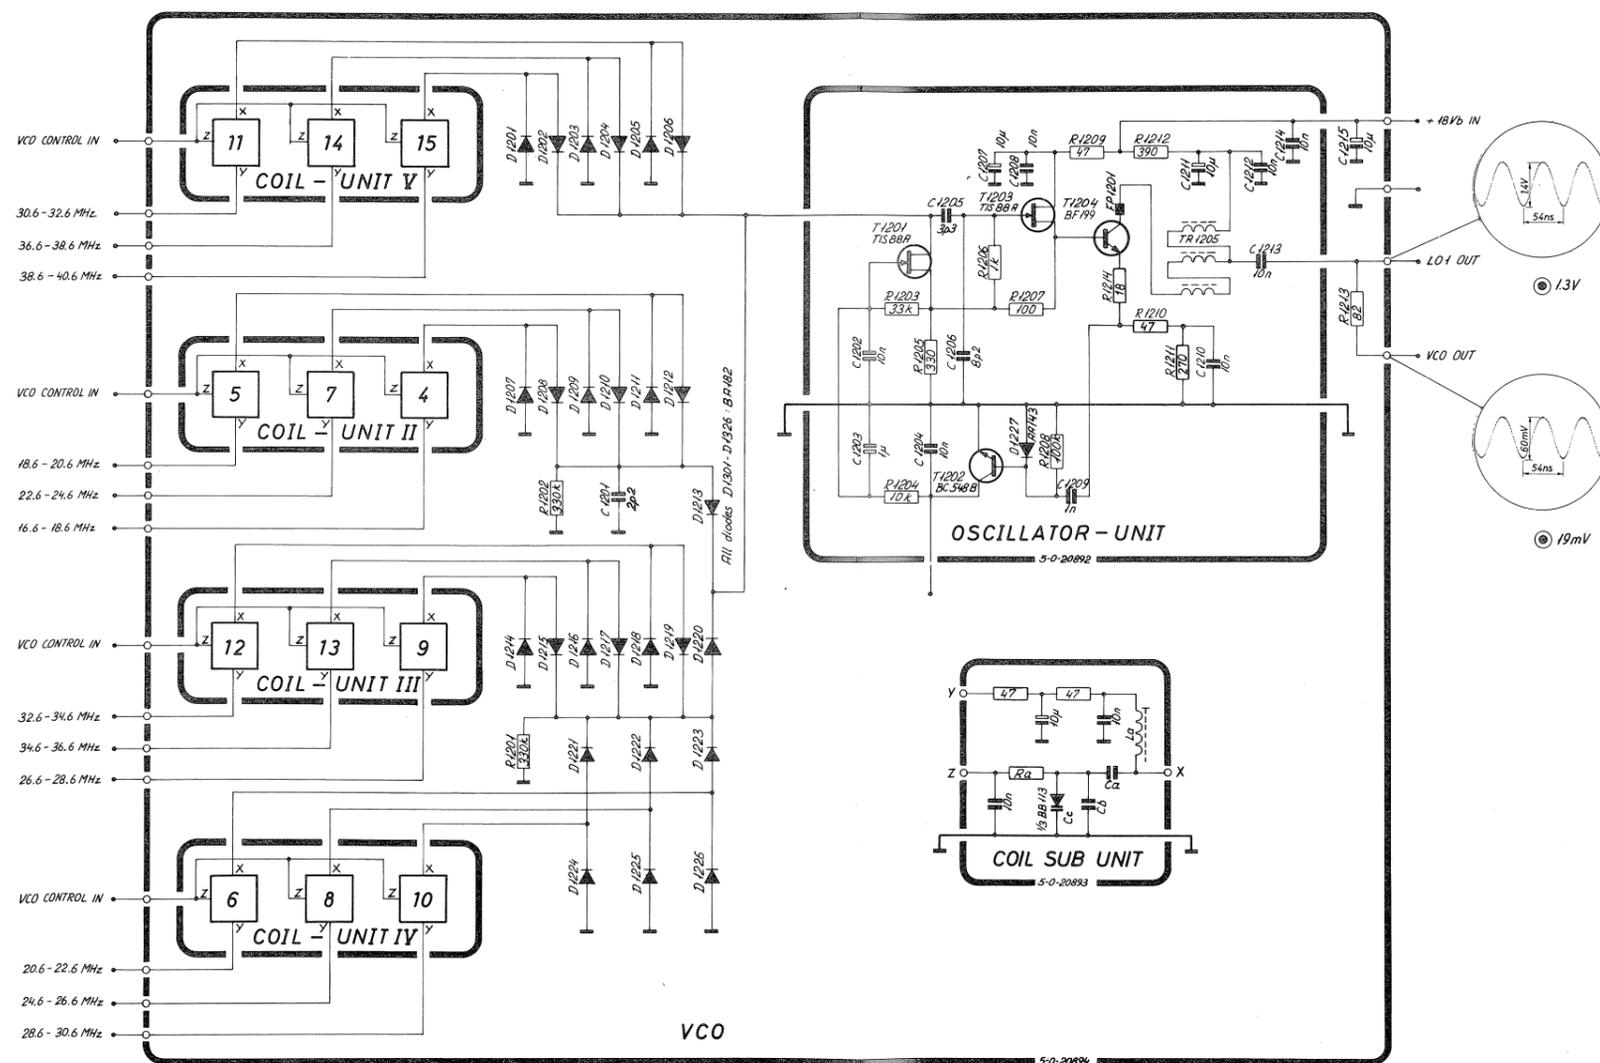

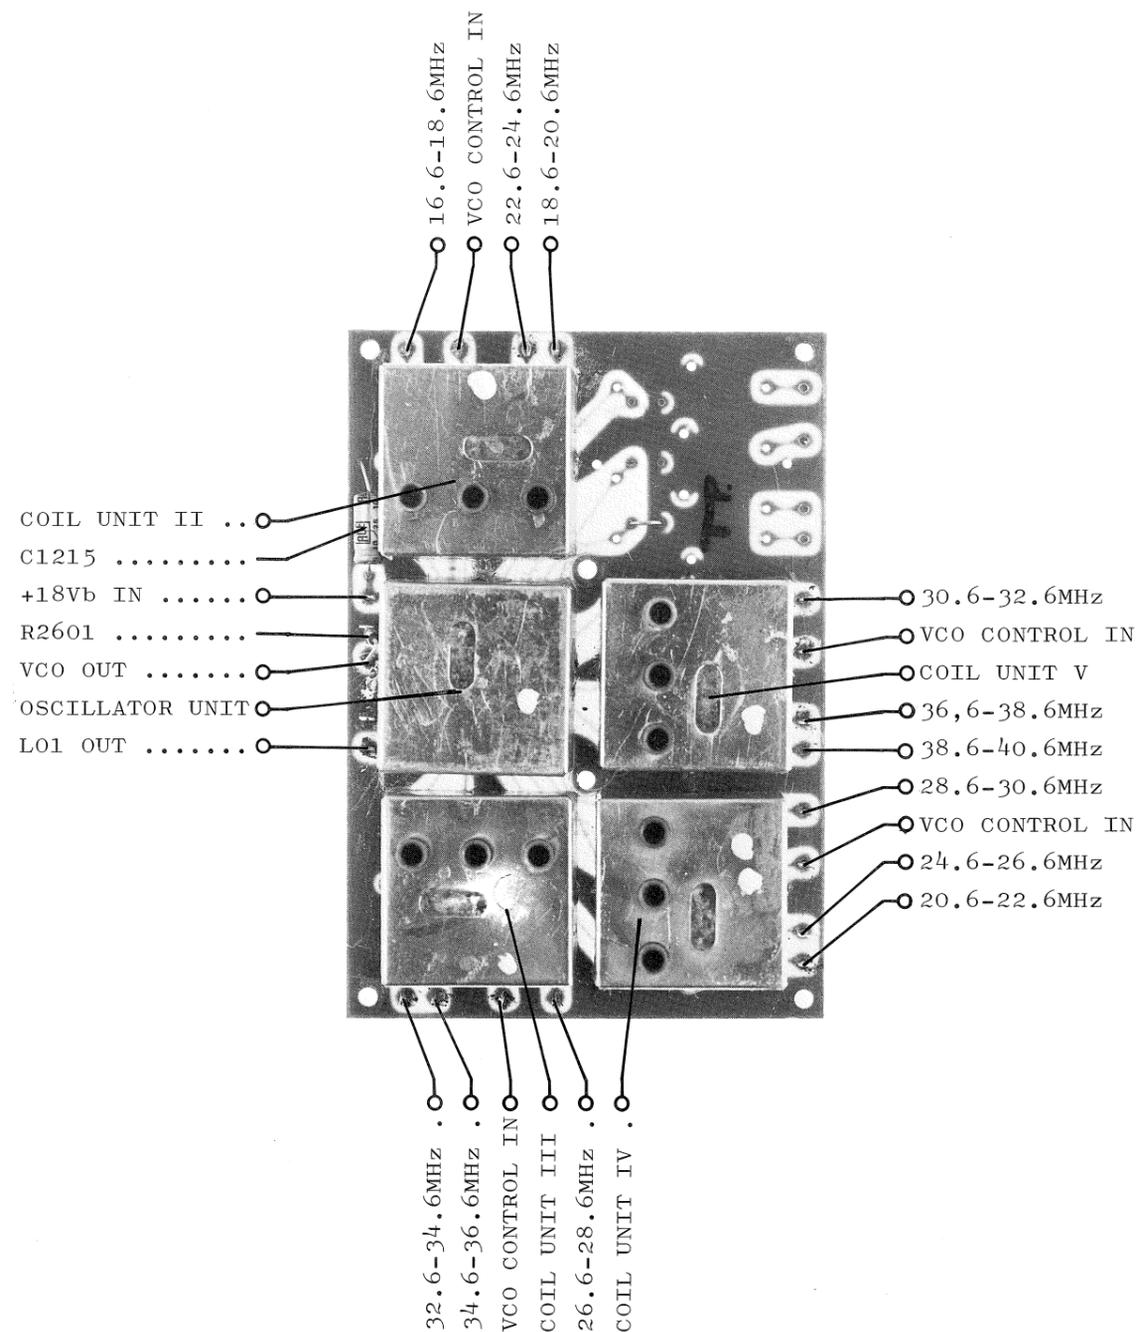

# CIRCUIT DESCRIPTION VCO-UNIT R1119, R1120 & R1121

This unit contains in principle twelve VCO's, and is constructed in such a way that it contains one single oscillator unit and twelve coil units switched in and out by the diodes D1201 to D1226. The oscillator circuit is made up of T1201 and T1203, the output signal is fed through the buffer amplifier T1204. The signal current in T1204 is measured by the level detector C1209, R1208 and D1227 and T1202. It regulates the oscillator amplitude to maintain a constant output voltage.

The oscillator unit is factory adjusted and sealed and cannot be repaired in the field, it must be replaced and can be repaired at the factory.

## CIRCUIT DESCRIPTION LOOP 1 MIXER R1119, R1120 & R1121

This unit mixes together the VCO signal and the signal from the harmonic filter and filters out the difference frequency to supply the variable divider.

The VCO signal is fed via C1401 to the buffer amplifier T1401, and after that to the integrated balanced mixer IC1401. To this, the harmonic filter signal is applied via C1405. Output from the mixer is fed into the combiner transformer TR1401 feeding into the lowpass filter containing L1402, L1493, C1410, C1411, C1412 and C1413. This lowpass filter filters out the wanted mixing product and prevents the two local oscillator signals from reaching the variable divider. The filtered signal is amplified in the output amplifier T1402.

## CIRCUIT DESCRIPTION VCO-BUFFER R1119, R1120 & R1121

This unit contains the VCO buffer amplifier.

The signal from the VCO unit enters the base of T1501 via the frequency compensating capacitor C1502. Capacitor C1503 and resistor R1506 are part of the frequency compensating circuit.

From the collector of T1501 the signal is fed to the 1st and 2nd mixer circuit board via the impedance step down transformer L1501.

### TEST CONDITIONS

5-0-22183

## CIRCUIT DESCRIPTION VCXO 1<sup>ST</sup> LOOP 2 MIXER & LOOP 2 FILTER R1119, R1120 & R1121

This unit contains the Loop 2 integrator, the summing amplifier, the voltage controlled crystal oscillators (VCXO's) and the first Loop 2 mixer.

### LOOP 2 INTEGRATOR

The integrator is built-up around IC1601a, the integration capacitor is C1609. R1628 feeds current into the diode coupled Darlington pair in the phase comparator IC1013 on the divider board in order to perform the 1.5V reference voltage. The output from the integrator pin 1 feeds into pin 5 of the summing amplifier.

### SUMMING AMPLIFIER

The IC1601b sums up two signals namely the output from the integrator and the informations from the 100 Hz setting. This information is weighed by means of the resistors R1617, R1618, R1619, R1620 and R1621. This summing is done to speed up the Loop 2 system in the continuous tuning mode.

The output, pin 7 of IC1601b, is fed to the VCXO's via a ripple filter consisting of R1616 and C1614.

### VCXO's

The VCXO's are crystal controlled Pierce Collpits oscillators, the frequency of which are tuned of variocap.'s D1601, D1605 and D1606.

For receiver frequencies below 14 MHz, the 16 MHz oscillator is working and for frequencies above 14 MHz, the 10 MHz one is working.

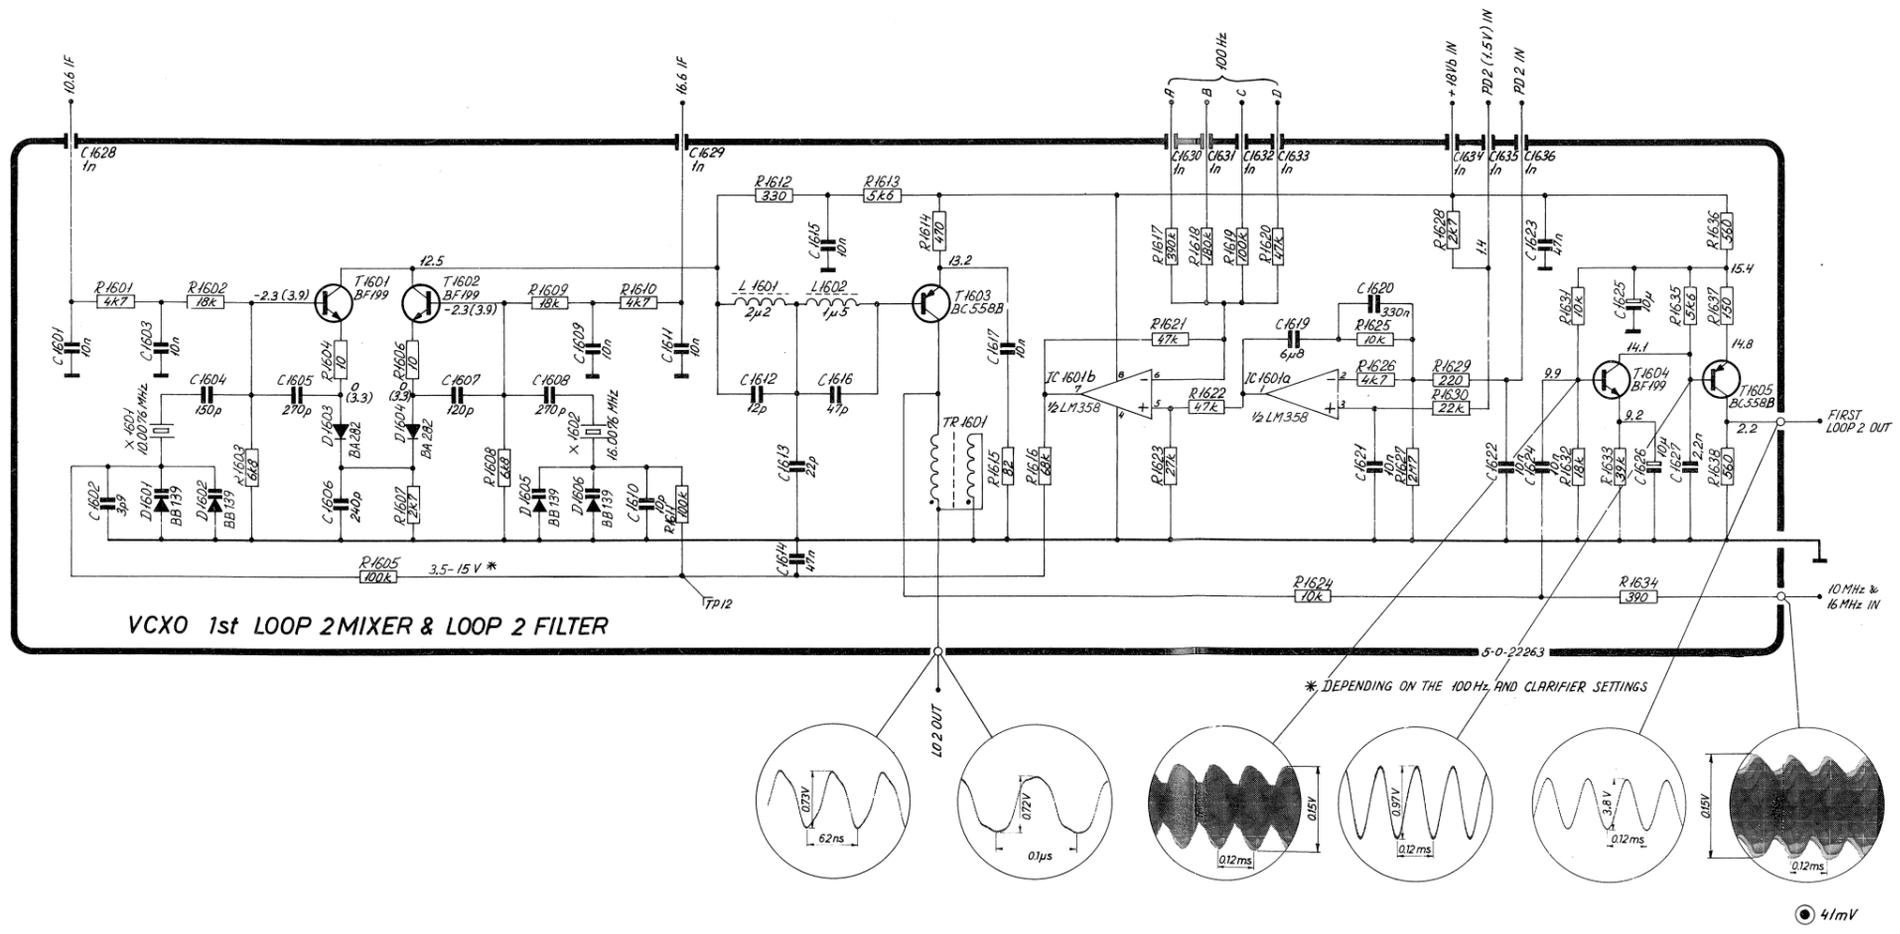

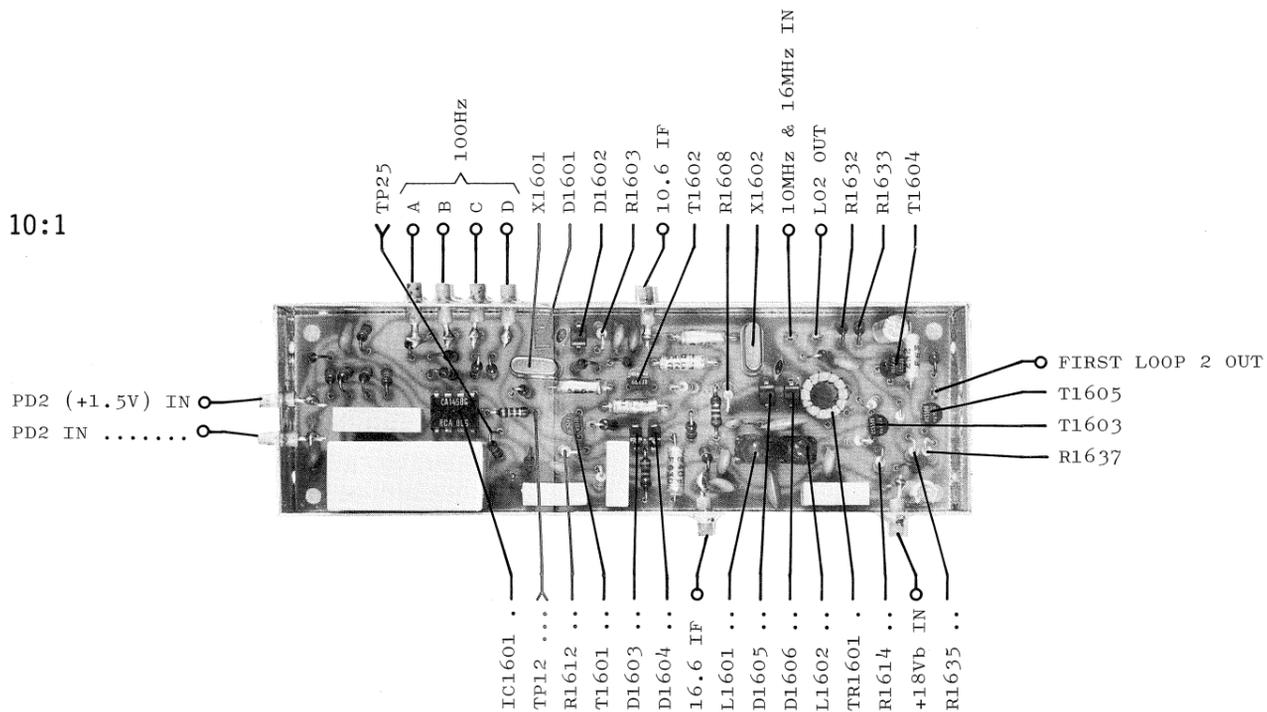

The outputs from the VCXO's are fed to the lowpass filter consisting of L1609, L1610, C1612, C1613 and C1616, and then to the buffer amplifier T1603 and out via the impedance step down transformer TR1601 to the 2nd mixer located at the 1st and 2nd mixer circuit board. A portion of the oscillator signal is fed to the first Loop 2 mixer via R1624.

### FIRST LOOP 2 MIXER

As mentioned above the VCXO signal is fed into the base of mixer transistor T1604, together with the 10 MHz and 16 MHz signals from the divider unit. Because of the big difference between the mixer frequencies and the output frequency, the only filtering needed to filter out the wanted mixing product is R1635 and C1627. The mixer transistor is feeding into the output amplifier T1605.

TEST CONDITIONS

## CIRCUIT DESCRIPTION CLARIFIER AND 2ND LOOP 2 MIXER R1119, R1120 & R1121

This unit contains the clarifier AF oscillator, 2nd Loop 2 mixer and a lowpass filter.

### AF OSCILLATOR

The AF oscillator consists of the transistor T1701 and the tuned circuit L1701, C1702, C1703 and the clarifier control capacitors C2601, C2602 and C2603. The nominal frequency is 7 kHz (clarifier to center pos.).

### 2nd LOOP 2 MIXER

From the collector of T1701 the signal is fed to the base of the 2nd Loop 2 mixer T1702, where it is subtracted from the other injection signal, having a nominal frequency range from 3.1 kHz to 9.0 kHz (clarifier to center pos.).

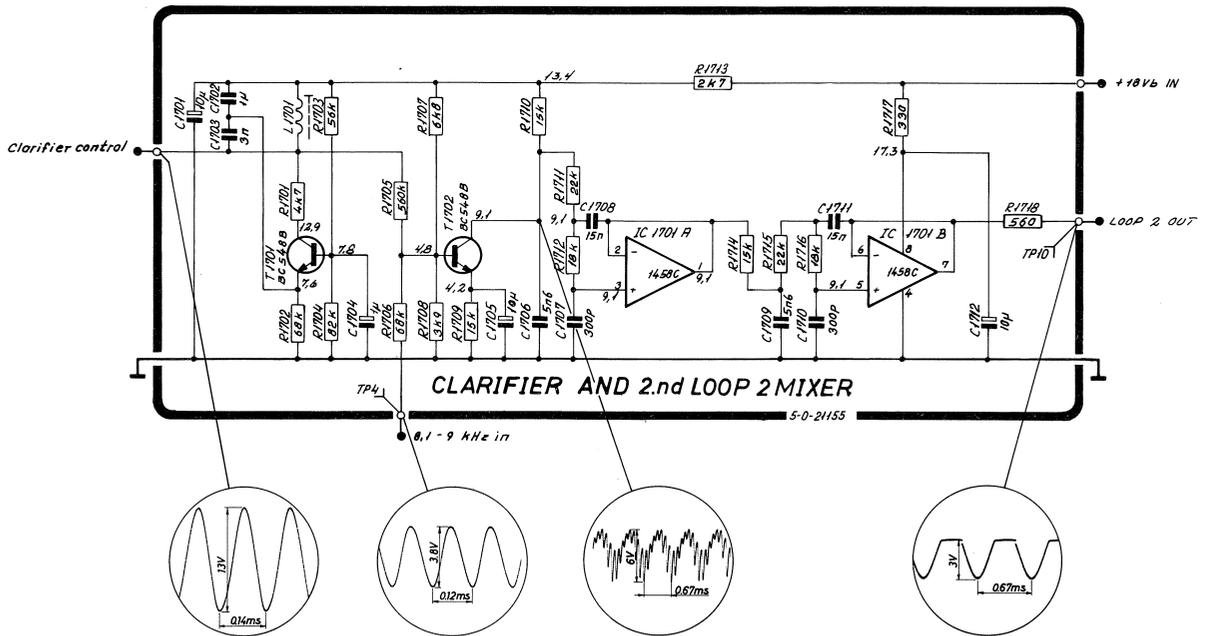

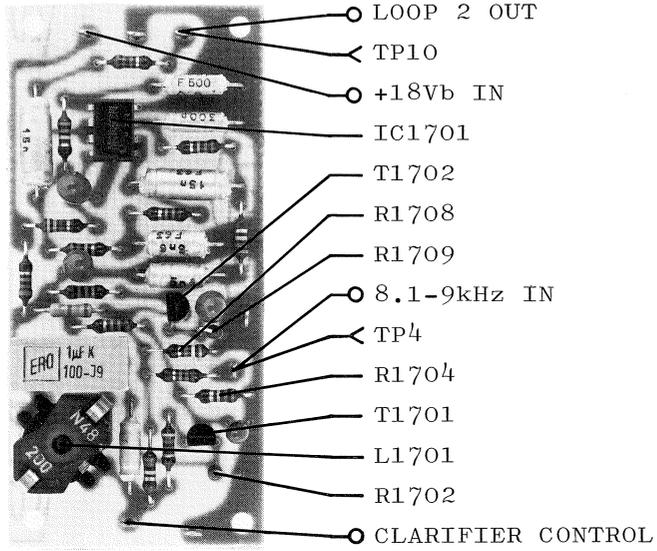

### LOWPASS FILTER

The mixed signal on the collector of T1702 is fed to a sixth order active lowpass filter with a cut-off frequency of 3.5 kHz, thus allowing the difference frequency to pass through. The nominal output frequency range is 1.1 kHz - 2.0 kHz. The filter is built-up around IC1701a and IC1701b. The output frequency is fed to the programmable divider on the divider unit.

### TEST CONDITIONS

## CIRCUIT DESCRIPTION RF FILTERS 2.5-3.1 MHz AND 3.1-3.8 MHz

The PCB contains two filters. Both are designed as third order filters of the bilinear type.

The protection of the filters are done through the reverse biased diodes D1801, D1802, the capacitors C1807, C1808 and the resistor R101 located on the aerial switch PCB. The output of the filters is led through the switch diodes D2009 and D2010, respectively, located on 16.6 MHz notch filter PCB (module 2000) into the mixer (module 500).

The capacitors C1801, C1803 and C1802, C1804 provide the impedance transformation from low to high.

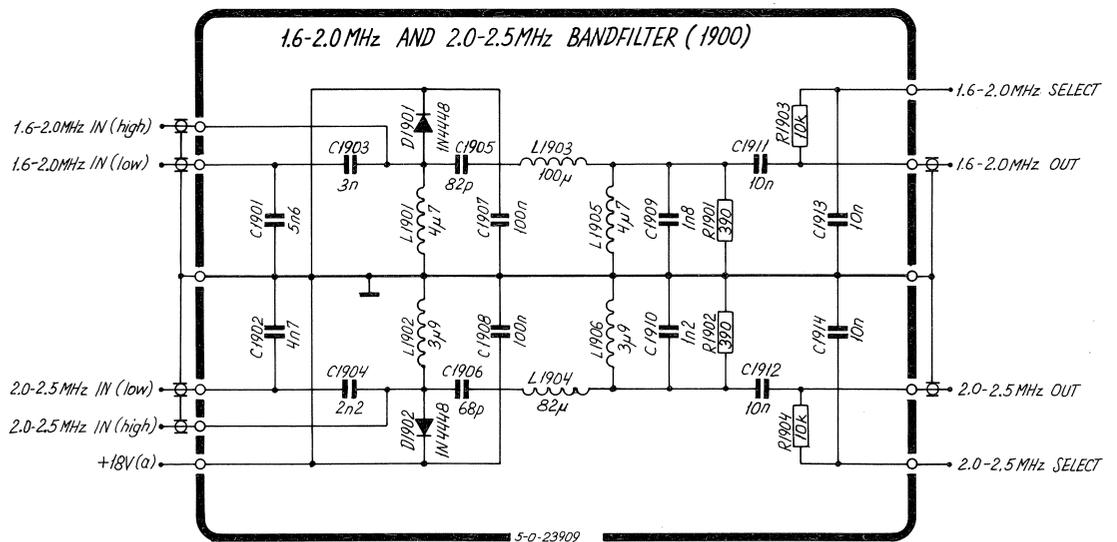

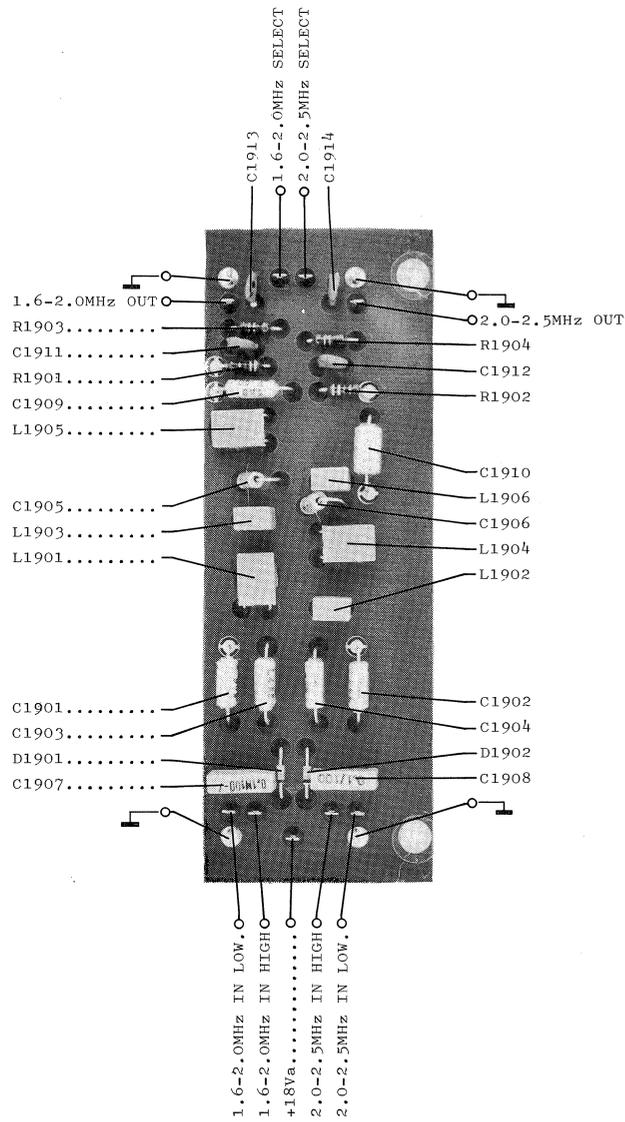

## CIRCUIT DESCRIPTION RF FILTERS 1.6-2.0 MHz AND 2.0-2.5 MHz

The PCB contains two filters. Both are designed as third order filters of the bilinear type.

The protection of the filters are done through the reverse biased diodes D1901, D1902, the capacitors C1907, C1908 and the resistor R101 located on aerial switch PCB.

The output of the filters is led through the switch diodes D2007 and D2008, respectively, located on 16.6 MHz notch filter PCB (module 2000) into the mixer (module 500).

The capacitors C1901, C1903 and C1902, C1904 provide the impedance transformation from low to high.

## CIRCUIT DESCRIPTION OF 16.6 MHz NOTCH FILTER

The filter consists of the two resistors R2001, R2002, the two capacitors C2001, C2003 and the series resonant circuit L2001, C2002.

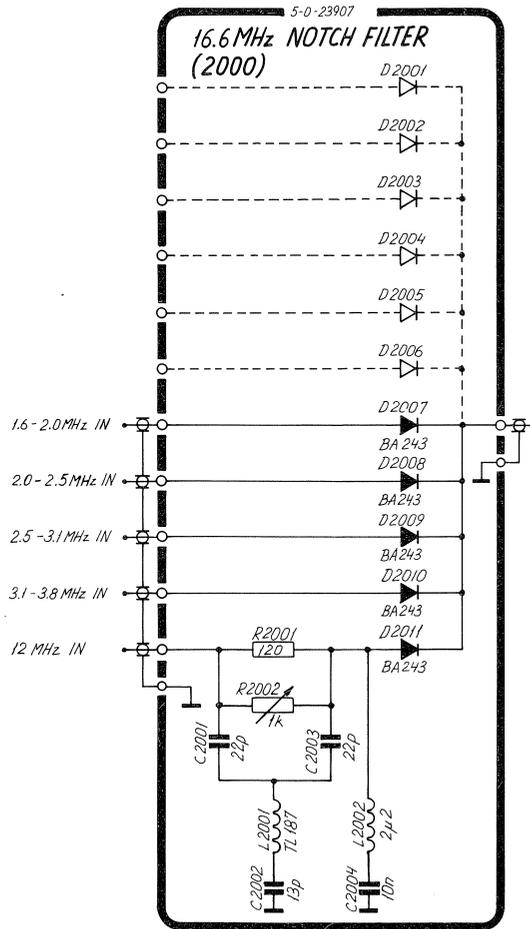

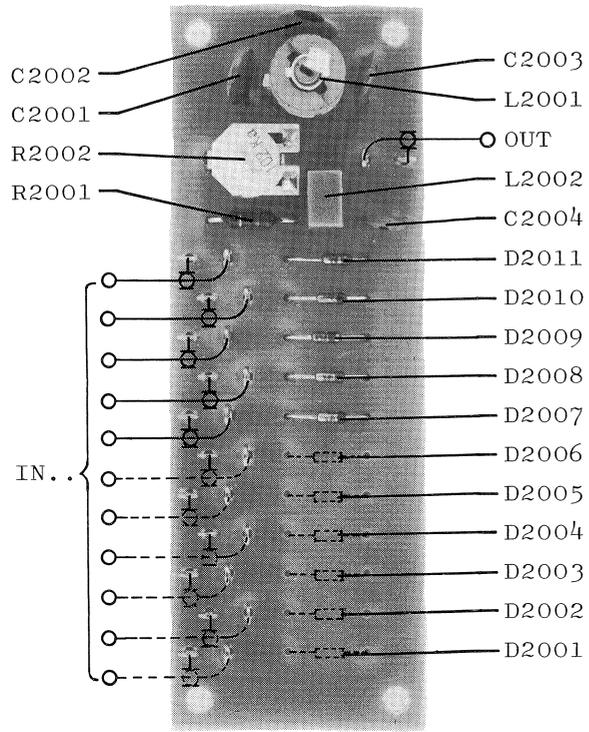

The resonant frequency of L2001 and C2002 determines the notch frequency, which is 16.6 MHz.

The resistors R2001 and R2002 determine the filter attenuation at the notch frequency and R2002 is trimmed to give maximum attenuation.

The inductance L2002 is used to compensate for the capacitive load of the notch filter, and the capacitor C2004 prohibits DC-current to flow in the inductance.

The diodes D2007-D2011 is used to switch in and out the selected RF-filter sections 1.6-2.0 MHz, 2.0-2.5 MHz, 2.5-3.1 MHz, 3.1-3.8 MHz and 12 MHz.

RII21A 4-0-23907  
4-6-23907

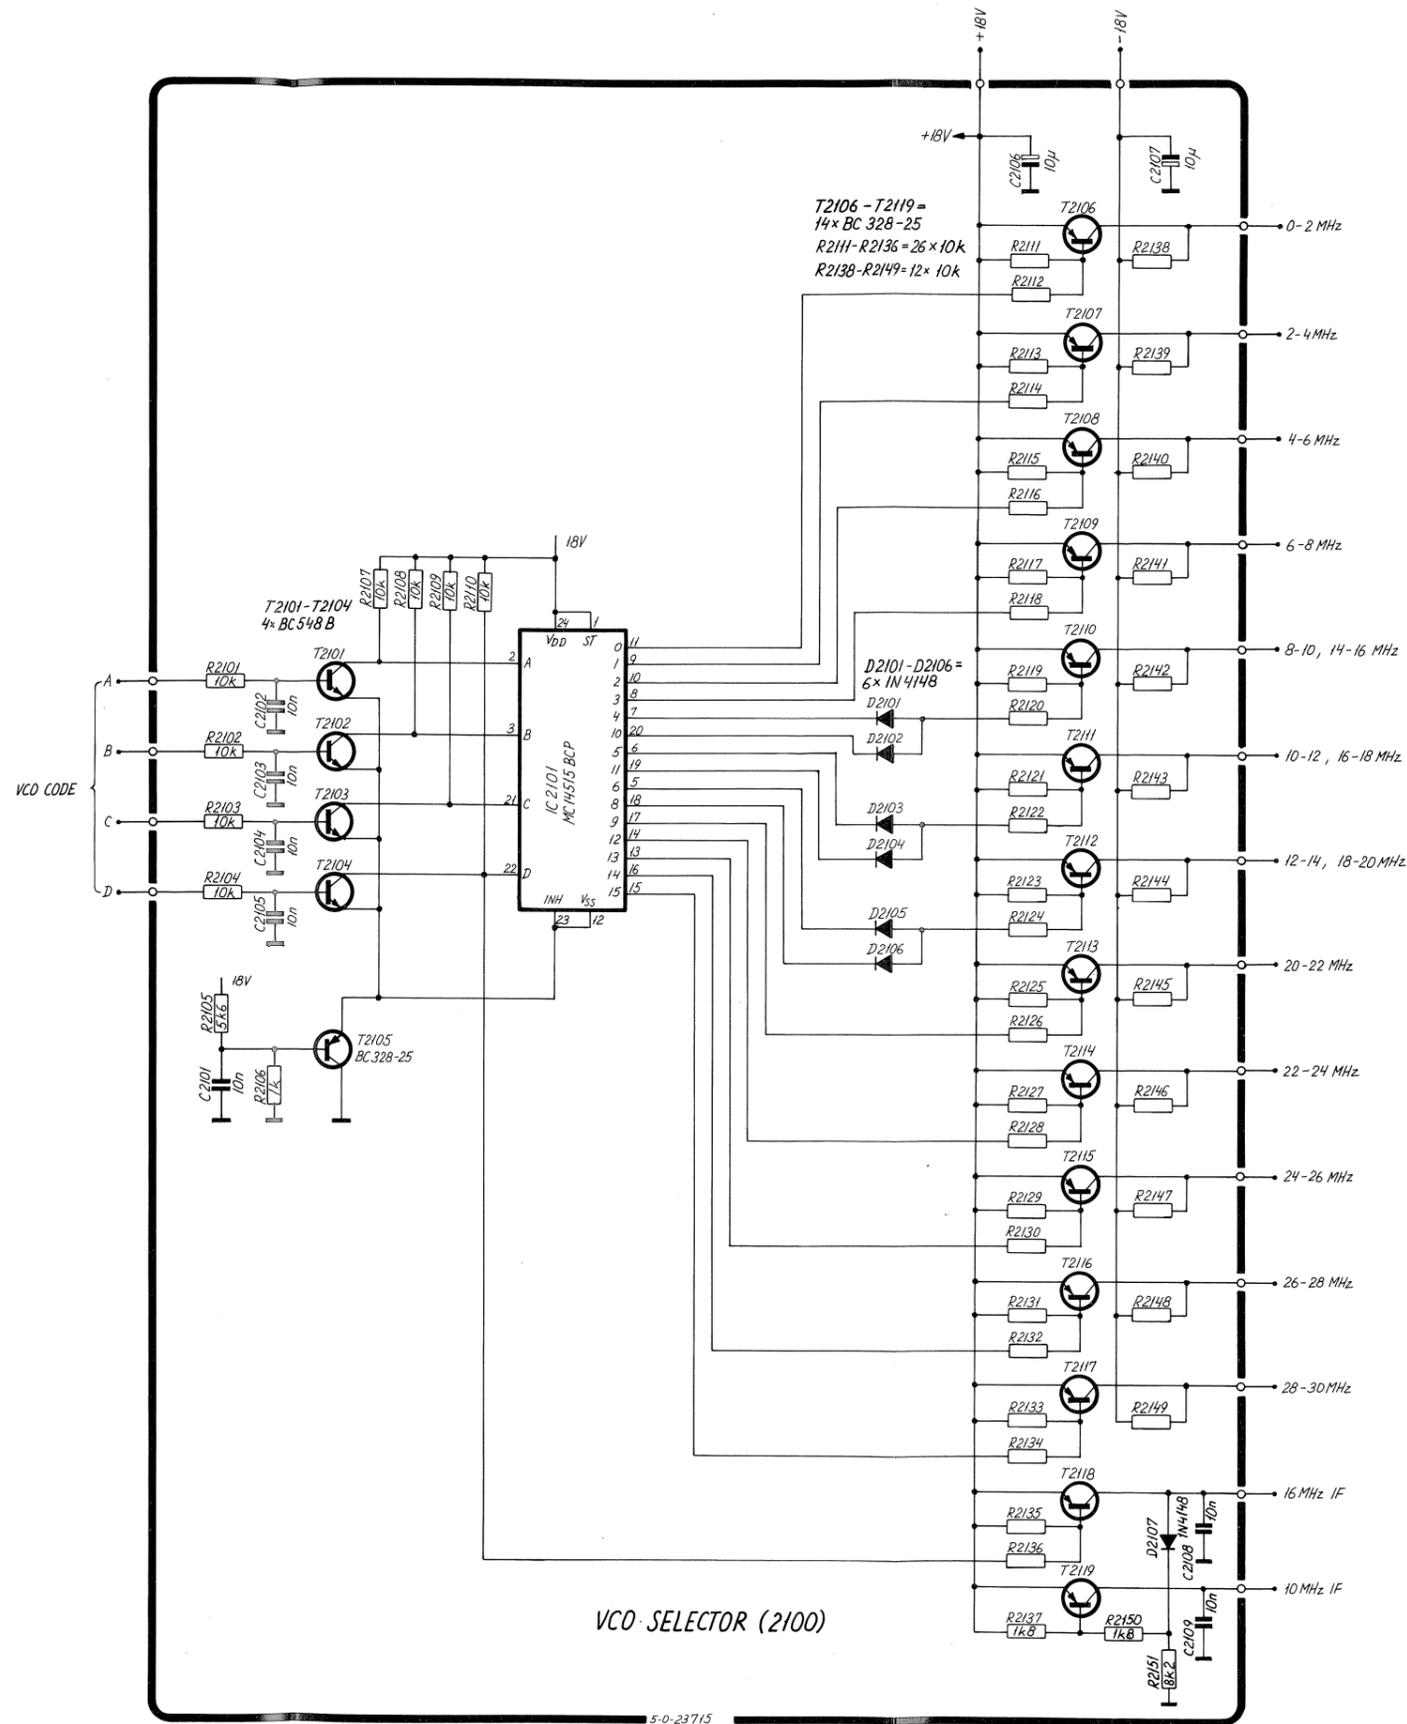

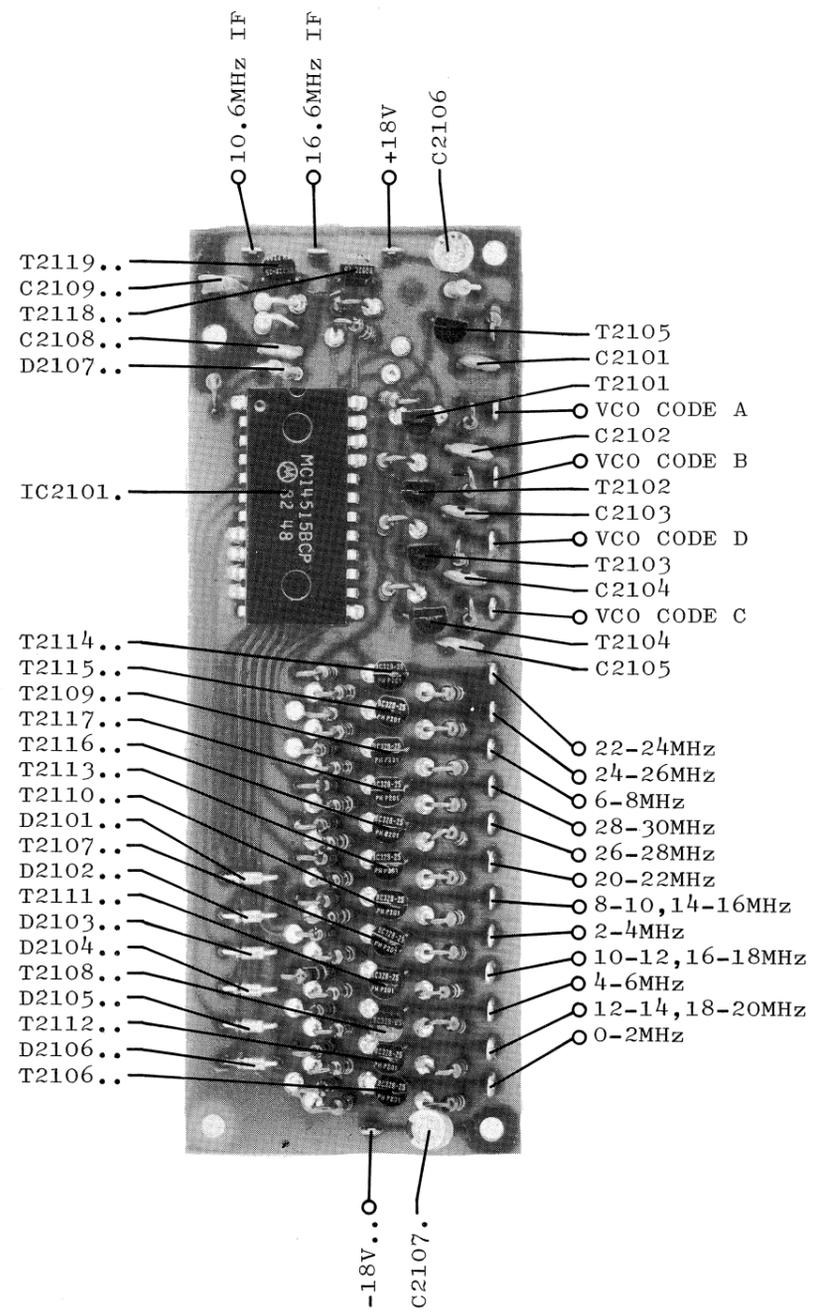

## CIRCUIT DESCRIPTION VCO SELECTOR R1121

The actual VCO is selected by one of the driver transistor T2106 - T2117. The transistor in question is selected from the 4 to 16 line decoder IC2101, which pulls low the output indicated by the 4-bit code on the inputs (A, B, C, D).

The 4-bit code is generated on the interface circuit board and is fed to IC2101 via the level shift transistors T2101 - T2104.

The IF selection is controlled by the most significant bit in the 4-bit code. T2118 and T2119 act as drivers for the real IF shift which takes place in the first mixer.

## CIRCUIT DESCRIPTION INTERFACE UNIT R1121

The interface unit supervises the serial output from the ARQ unit (H1240). This output provides for the information to the printer and the scanning receiver R1121. With addresses contained in this information, it is possible to control several units on the same line. The interface unit in R1121 handles data addressed to RX1, RX2, RX3, TX1, TX2 and PR1 (these addresses are selected from the keyboard processor H1249). RX data are converted to parallel data which control the frequency of R1121. TX data are by means of two lines transmitted to the exciter S1303/04 and printer data are transmitted serially on one line to the printer.

The interface unit has a single chip microcomputer IC2206 which as clock generator has a 2.5 MHz signal. This is the 10 MHz TCXO signal amplified in two transistors, T2201, T2202, and divided by four in IC2207. The processor receives the data input from the RD input via IC2208b which converts the +12V/-12V level at the RD input to 0V/5V level as the processor demands.

When the data are addressed to RX1 or RX2, the receive frequency is put on the divider via the data registers IC2204 and IC2205 plus the A7 output of the microcomputer. IC2203 holds the code for selection of VCO and front-end filter. The code held by IC2202 controls AGC and IF filter selection.

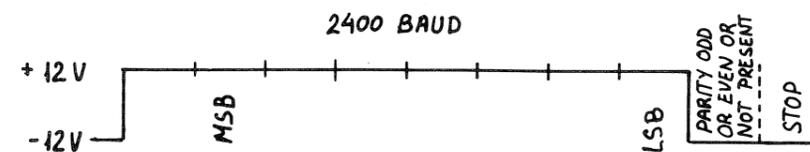

By RX1, telex filter and telex AGC are active. By RX2, SSB filter and SSB AGC are active. When choosing RX3 it is possible to change the condition of RE2201 and thereby lead an AF signal from another receiver than R1121 to the ARQ (H1240).

When the data are addressed to TX1 or TX2 the data format is changed in R1121 from an asynchrone signal to a synchrone signal consisting of 24 clock pulses with corresponding data information which via the buffers IC2209b and IC2209a (TXC, TXD) are fed to an exciter S1303/04.

During the data transmission to S1303/04 from R1121 the busy output is low as the interface processor is not able to receive data from the ARQ when it is transmitting.

If the data are addressed to PR1 the interface unit will cut-out the address in the asynchrone data format from the ARQ and lead the remaining character data to the printer. Output to the printer is the TD connection and the SSD input is a signal which tells if the printer is busy and not able to receive more characters.

The asynchrone data format from ARQ to R1121 and from R1121 to printer is an 8 bit word with start and stop bit. The data from the ARQ may contain a parity bit. The speed is 2400 baud on both lines.

Signal on RD input of the interface unit.

**CIRCUIT DESCRIPTION INTERFACE UNIT R1121 cont.:**

The information from ARQ to R1121 contains three types of words, i.e. address word, command word and data word.

Address: 110XXXXX where XXXXX indicates the address 0-31.

Command: 0001YYYY where YYYY indicates the amount of following data words.

Data: ZZZZZZZZ 8-bit data

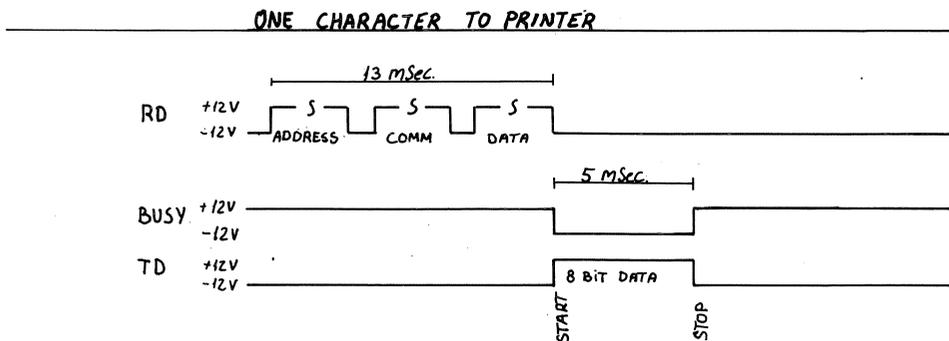

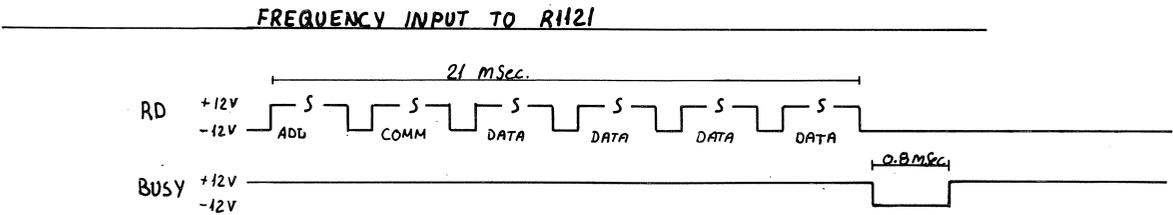

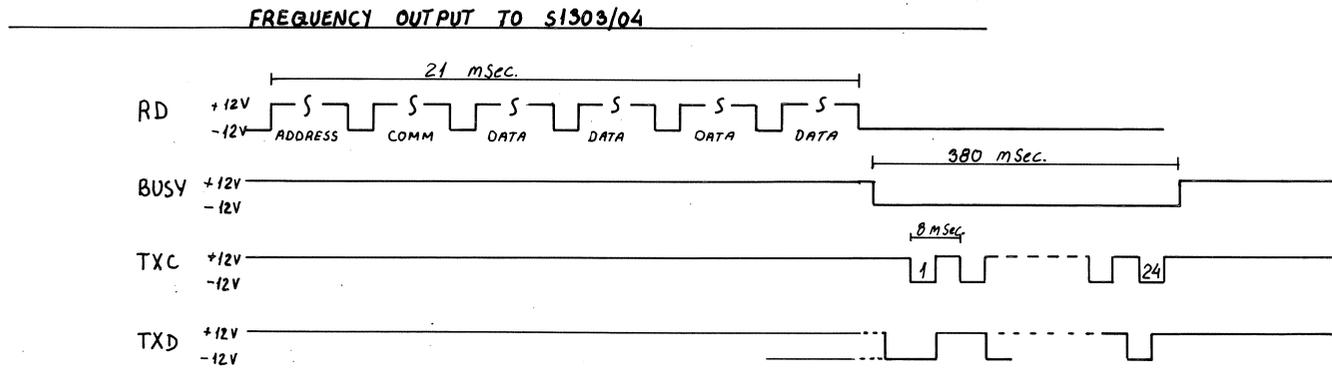

A frequency input looks like this:

address    command    10 MHz 1 MHz 100 kHz 10 kHz 1 kHz 100 Hz 10 Hz 1 Hz

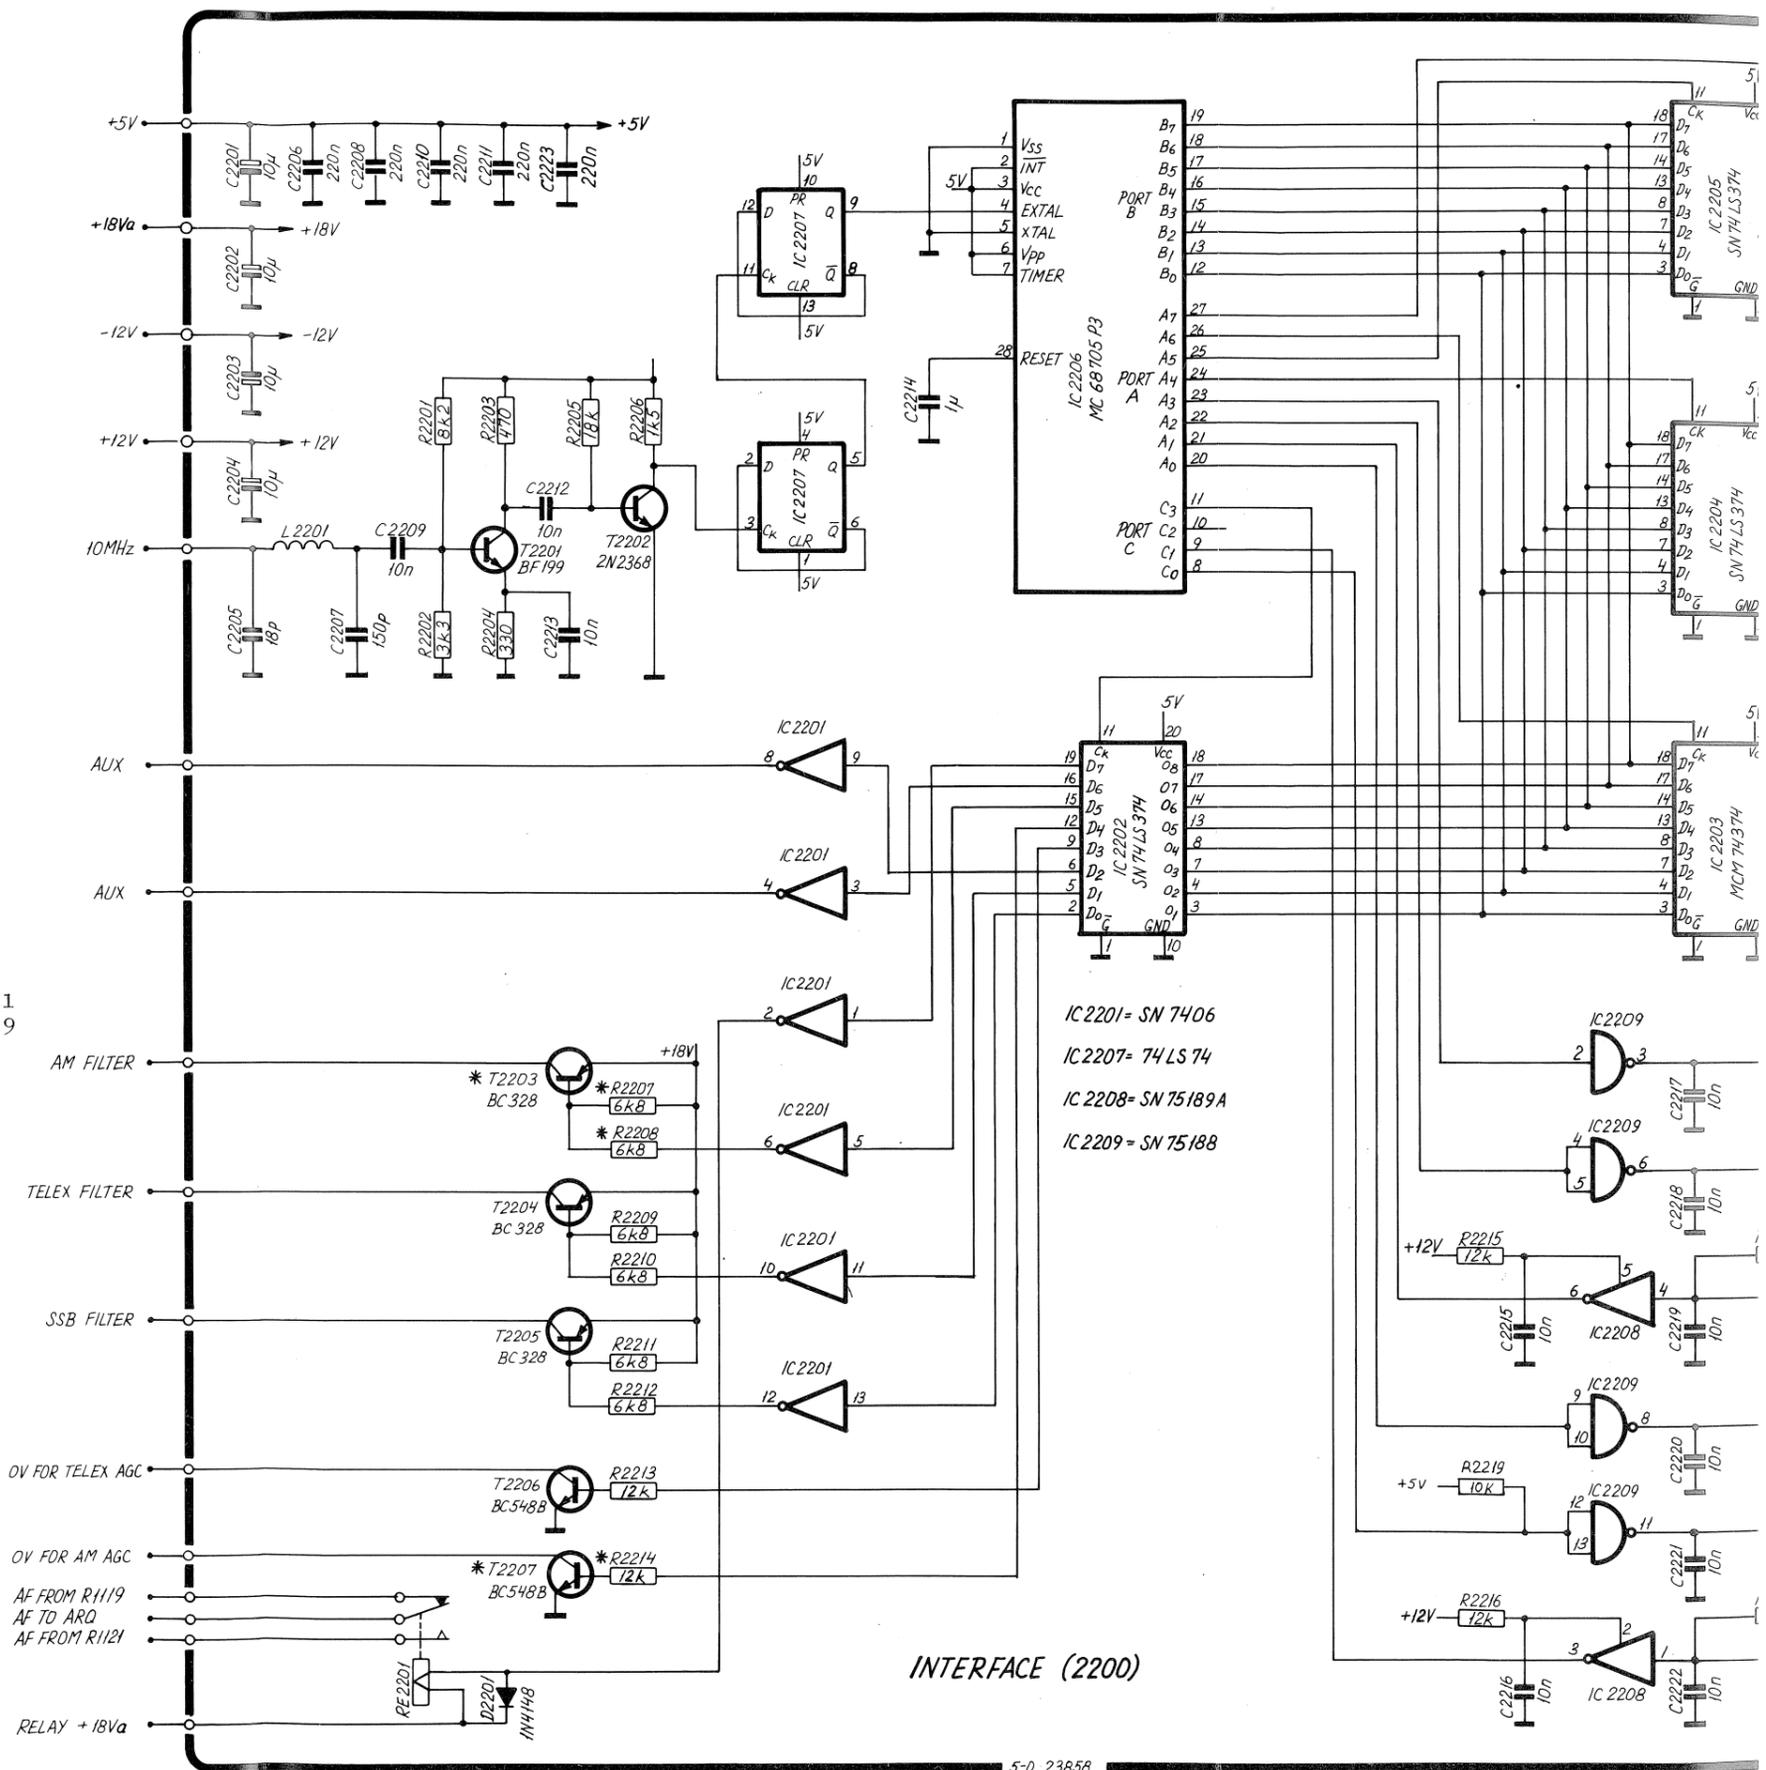

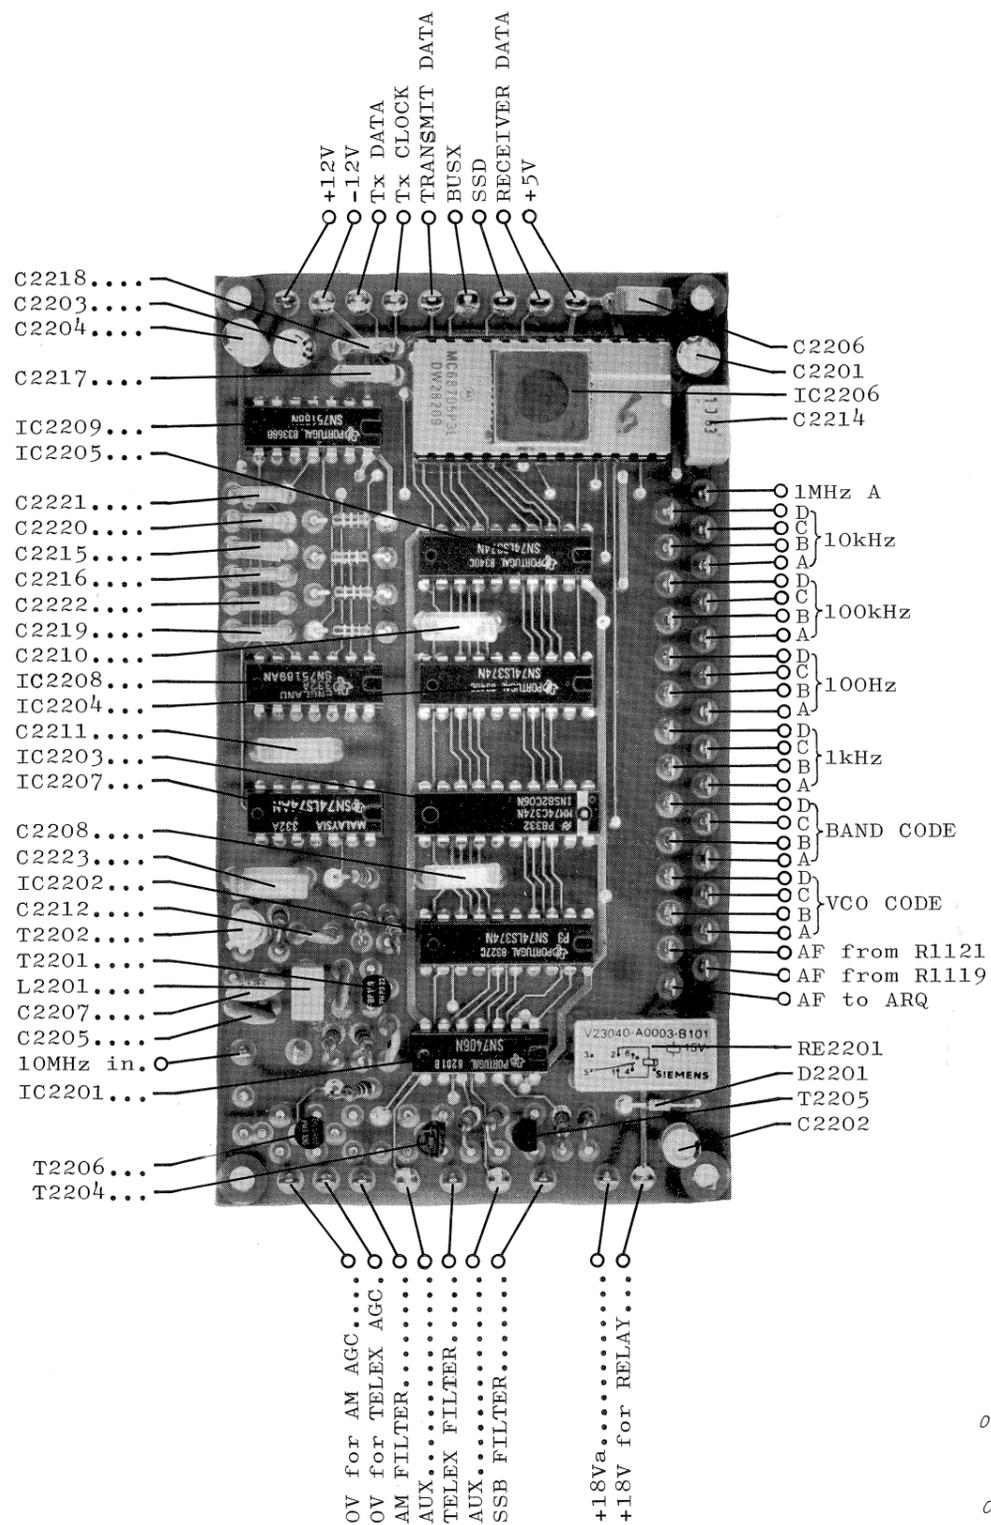

A printer character input looks like this:

address    command    character
