1. INTRODUCTION

The SAILOR RT2048 VHF radiotelephone has been designed to comply with the increasing demands of a highly technological product, which means high quality, small size, etc.

The SAILOR RT2048 is furthermore designed to fit into the SAILOR Compact 2000 module programme.

The SAILOR RT2048 can either be installed and operated as an independent unit, or in combination with other elements of the Compact 2000 programme. These include a Duplex VHF radiotelephone, a coast telephone station with a 400W PEP SSB transmitter and an SSB receiver with built-in FM and AM bands, and a scrambler which ensures complete communication secrecy.

The SAILOR VHF RT2048 has, by means of the latest technology in casting technique, been constructed to withstand the most extreme conditions experienced in small, semi-open boats. Inside, the printed circuits, which have made possible a combination of compactness and exceptional performance, are coated with a special moisture repellent lacquer.

In the design of this VHF radiotelephone, S. P. Radio have taken into account all the circumstances it will be exposed to in day-to-day operation. However, even a product of this high quality requires regular servicing and maintenance, and we recommend a close observance of the directions contained in the instruction book.

S. P. Radio is one of Europe's leading producers of maritime radio communication equipment - a position which has been maintained by means of constant and extensive product development. We have a world-wide network of dealers with general agencies in fifty countries. All our dealers are well-trained and able to service all SAILOR products.

1.1. GENERAL DESCRIPTION

SAILOR VHF RT2048 is an all solid state constructed microcomputer controlled VHF radiotelephone, intended for ship/ship and ship/shore communication.

SAILOR VHF RT2048 can operate in both simplex and semi-duplex mode.

SAILOR VHF RT2048 includes all 55 international and U.S. VHF marine channels, and is as standard prepared for up to 10 private channels, selected as simplex or semi-duplex channels in the frequency band 154.4 - 163.75 MHz.

SAILOR VHF RT2048 is equipped with flexible scanning facilities or additional 30 private channels in the above mentioned frequency band.

SAILOR VHF RT2048 has built-in dual watch facility, which enables the operator to listen out on two channels simultaneously (the selected channel and a programmable preference channel - normally channel 16).

SAILOR VHF RT2048 is provided with a quick select channel, normally channel 16.

SAILOR VHF RT2048 is provided with continuous turn-style operation of SQ and AF level for optimum resolution.

SAILOR VHF RT2048 is provided with a push-button keyboard offering an attractive tactile feeling and a safe finger-guide in the metal front. Besides, the keyboard is fitted with night-illumination of the lettering from behind.

SAILOR VHF RT2048 has a high efficient LED read-out of channel number and other indications for optimum reading under all conditions.

SAILOR VHF RT2048 is a modern transceiver with an all synthesized frequency generation based on a single crystal.

SAILOR VHF RT2048 has a built-in 12W AF power amplifier, which delivers 6W into the large built-in loudspeaker.

SAILOR VHF RT2048 is for 12V DC supply. Voltage change-over from 24V to 12V is easily done by the power supply N420.

SAILOR VHF RT2048 has an extremely low standby current consumption, typically below 100 mA.

SAILOR VHF RT2048 is housed in a corrosion resistant metal cabinet with a green nylon finish.

SAILOR VHF RT2048 can be delivered with a built-in selcall decoder, which will decode a selective call CA or all ships call CQ.

1.2. TECHNICAL DATA

Fulfils the international CEPT regulations.

GENERAL

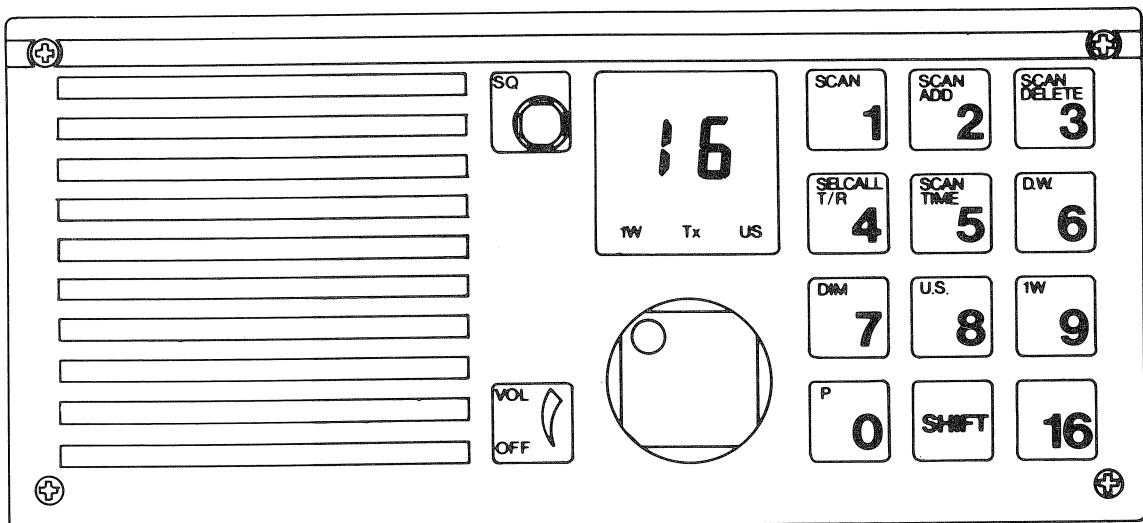

All international maritime VHF channels.	
Private channels:	10, may be extended to 40
Operation:	Simplex and semi-duplex
Modulation:	G3EJN (Phase)
Antenna impedance:	50 ohm
Frequency stability:	+10 ppm (Spec. vers. ± 5 ppm)
Temperature range:	-20°C to +55°C
Nominal power supply:	13.2V DC
Power supply variation:	12V DC -10% to +30%
(with data according to international standards)	
Power consumption:	Standby = 0.1A Transmit = 5 A
Dimensions:	Height: 98 mm Width: 225 mm Depth: 160 mm
Weight:	3.1 kg

RECEIVER

Frequency range simplex:	154.40 - 159.15 MHz
Frequency semi-duplex:	159.00 - 163.75 MHz
Sensitivity:	0.25 uV PD at 12 dB SINAD
AF output power:	6 Watt/4 ohm
Telephone output:	0.5V RMS/200 ohm
Distortion:	Less than 5%
Scanning facilities:	Flexible scanning programme, with possibility for all international channels and 10 private channels.
Accessory:	Selcall decoder according to CCIR

TRANSMITTER

Frequency range normal:	154.40 - 159.15 MHz
Frequency range special:	159.00 - 163.75 MHz
RF output power:	25 Watt +0 to -0.5 dB
Reduced RF output:	0.5 to 1 Watt
Distortion:	Less than 5%

RT2048 A 4-0-25667

1.3. CONTROLS

Indication of ON/OFF/VOL turn-style knob operation.

Squelch sensitivity control knob with turn-style operation.

Quick selection of the call and distress channel 16.

Digits from 1 to 0

Activates the functions marked in orange on the keyboard.
Whenever the keyboard is in "shift-mode" it will be indicated by "cornerbars" in the display

Selects scanning programme.

Adds a channel to the scanning table.

Deletes a channel from the scanning table.

Selects the scan time from 1 to 99 seconds. The time chosen is the listening time on one of the secondary channels receiving a signal.

Selects the dual watch facility.

Selects 1W reduced power output.

1.3. CONTROLS cont.:

Selects the VHF channels used in the USA.

The intensity of the LED-indicators can be controlled in four steps. The keyboard illumination is switched on and off.

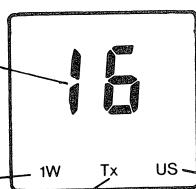

Tests the selcall decoder and resets the selcall decoder after a call.

Selects the standard private channels.

READ-OUT

Channel Read-Out All international maritime channels are shown by the two digits, when the channel has been keyed in. Selection of a standard private channel will be indicated with a P-.

Reduced Power

In harbour areas or in the close vicinity of another vessel, transmissions should be with reduced power. When the display shows 1W, the transmitter output power is reduced from 25W to 1W.

Where two stations are close together, this reduction can improve communication quality.

Transmitting

Whenever the handset switch is depressed, and the transmitter output power level has reached an appropriate level, the "TX" will appear.

US-Channels

In the USA a number of the international duplex channels are used as simplex channels. Ships sailing in American waters must therefore be able to select these channels as simplex channels. The appearance of "US" on the display indicates that this mode of operation is in use.

1.4. PRINCIPLE OF OPERATION

FREQUENCY GENERATION

All the internal frequencies are referenced to a crystal oscillator, running on 14.85 MHz.

The 14.85 MHz is divided by 4 in the REFERENCE DIVIDER, to generate a 3.7125 MHz signal, which is the input to the PLL-reference divider and clock-signal for the microcomputer.

The local oscillator signal for the first mixer in the receiver and the transmit signal are generated in a phase-locked loop (PLL). To generate the needed frequencies, which are specified as follows:

$$139.1 \text{ MHz} \leq f_{L01} \leq 148.45 \text{ MHz}; 154.5 \text{ MHz} \leq f_{TX \text{ NORMAL}} \leq 159.15 \text{ MHz}$$

$$159.0 \text{ MHz} \leq f_{TX \text{ SPECIAL}} \leq 163.75 \text{ MHz}$$

a bandshift is performed in the VCO.

The loop reference frequency - and so the resolution - is 12.5 kHz, derived by dividing the reference divider output with 297.

The VCO output frequency is divided down to 12.5 kHz after the dual-modulus principle with a PRESCALER dividing with 32/33.

The phase detector output controls the CHARGE PUMPE feeding the loop filter integrator.

If there is a difference in phase/frequency between the inputs to the phase detector. An error current from the charge pumpe will be integrated in the loop filter, producing the needed voltage for the VCO.

RECEIVER

The antenna signal is fed to the RX AMPLIFIER through the RX/TX relay.

The bandpass filters around the RX amplifier are tuned by means of capacitor diodes, which are controlled by a DC-voltage derived from the VCO control voltage in the PLL.

The received signal is converted to the first intermediate frequency on 15.3 MHz in the FIRST MIXER, using the VCO signal from the RX BUFFER AMPLIFIER as local oscillator signal.

The signal is filtered and amplified before down-conversion to 450 kHz in the SECOND MIXER. The crystal oscillator signal is used as local oscillator signal.

After filtering in the SECOND IF FILTER, the signal is amplified and detected.

The AF signal is passed through a mute switch before undergoing appropriate amplification and filtering to get the right frequency response.

Besides, the detected output is filtered in the SQUELCH FILTER before it is amplified, detected, and compared with a reference level to get a logical level for the microcomputer, which controls the mute circuit.

The telephone amplifier and the AF power amplifier produce the wanted output levels for the earpiece and the loudspeaker.

TRANSMITTER

The signal from the microphone is passed through a PRE-EMPHASIS network before appropriate amplification and compression in the AF AMPLIFIER COMPRESSOR.

This signal is filtered before it is fed to the VCO, where the modulation of the transmitter signal takes place.

As the VCO oscillates direct on the transmitting frequency in TX-mode, the signal only has to be amplified. This is done in the TX BUFFER AMPLIFIER and the TX POWER AMPLIFIER.

1.4. PRINCIPLE OF OPERATION cont.:

The power supply for the TX power amplifier is regulated by a feed-back loop via the POWER SENSE circuit to maintain constant output power level. Switching between full and reduced output power level is made by means of the PA-REGULATOR.

To reduce the level of harmonic components in the output signal it is passed through a HARMONIC FILTER before it is led to the antenna via the RX-TX-RELAY.

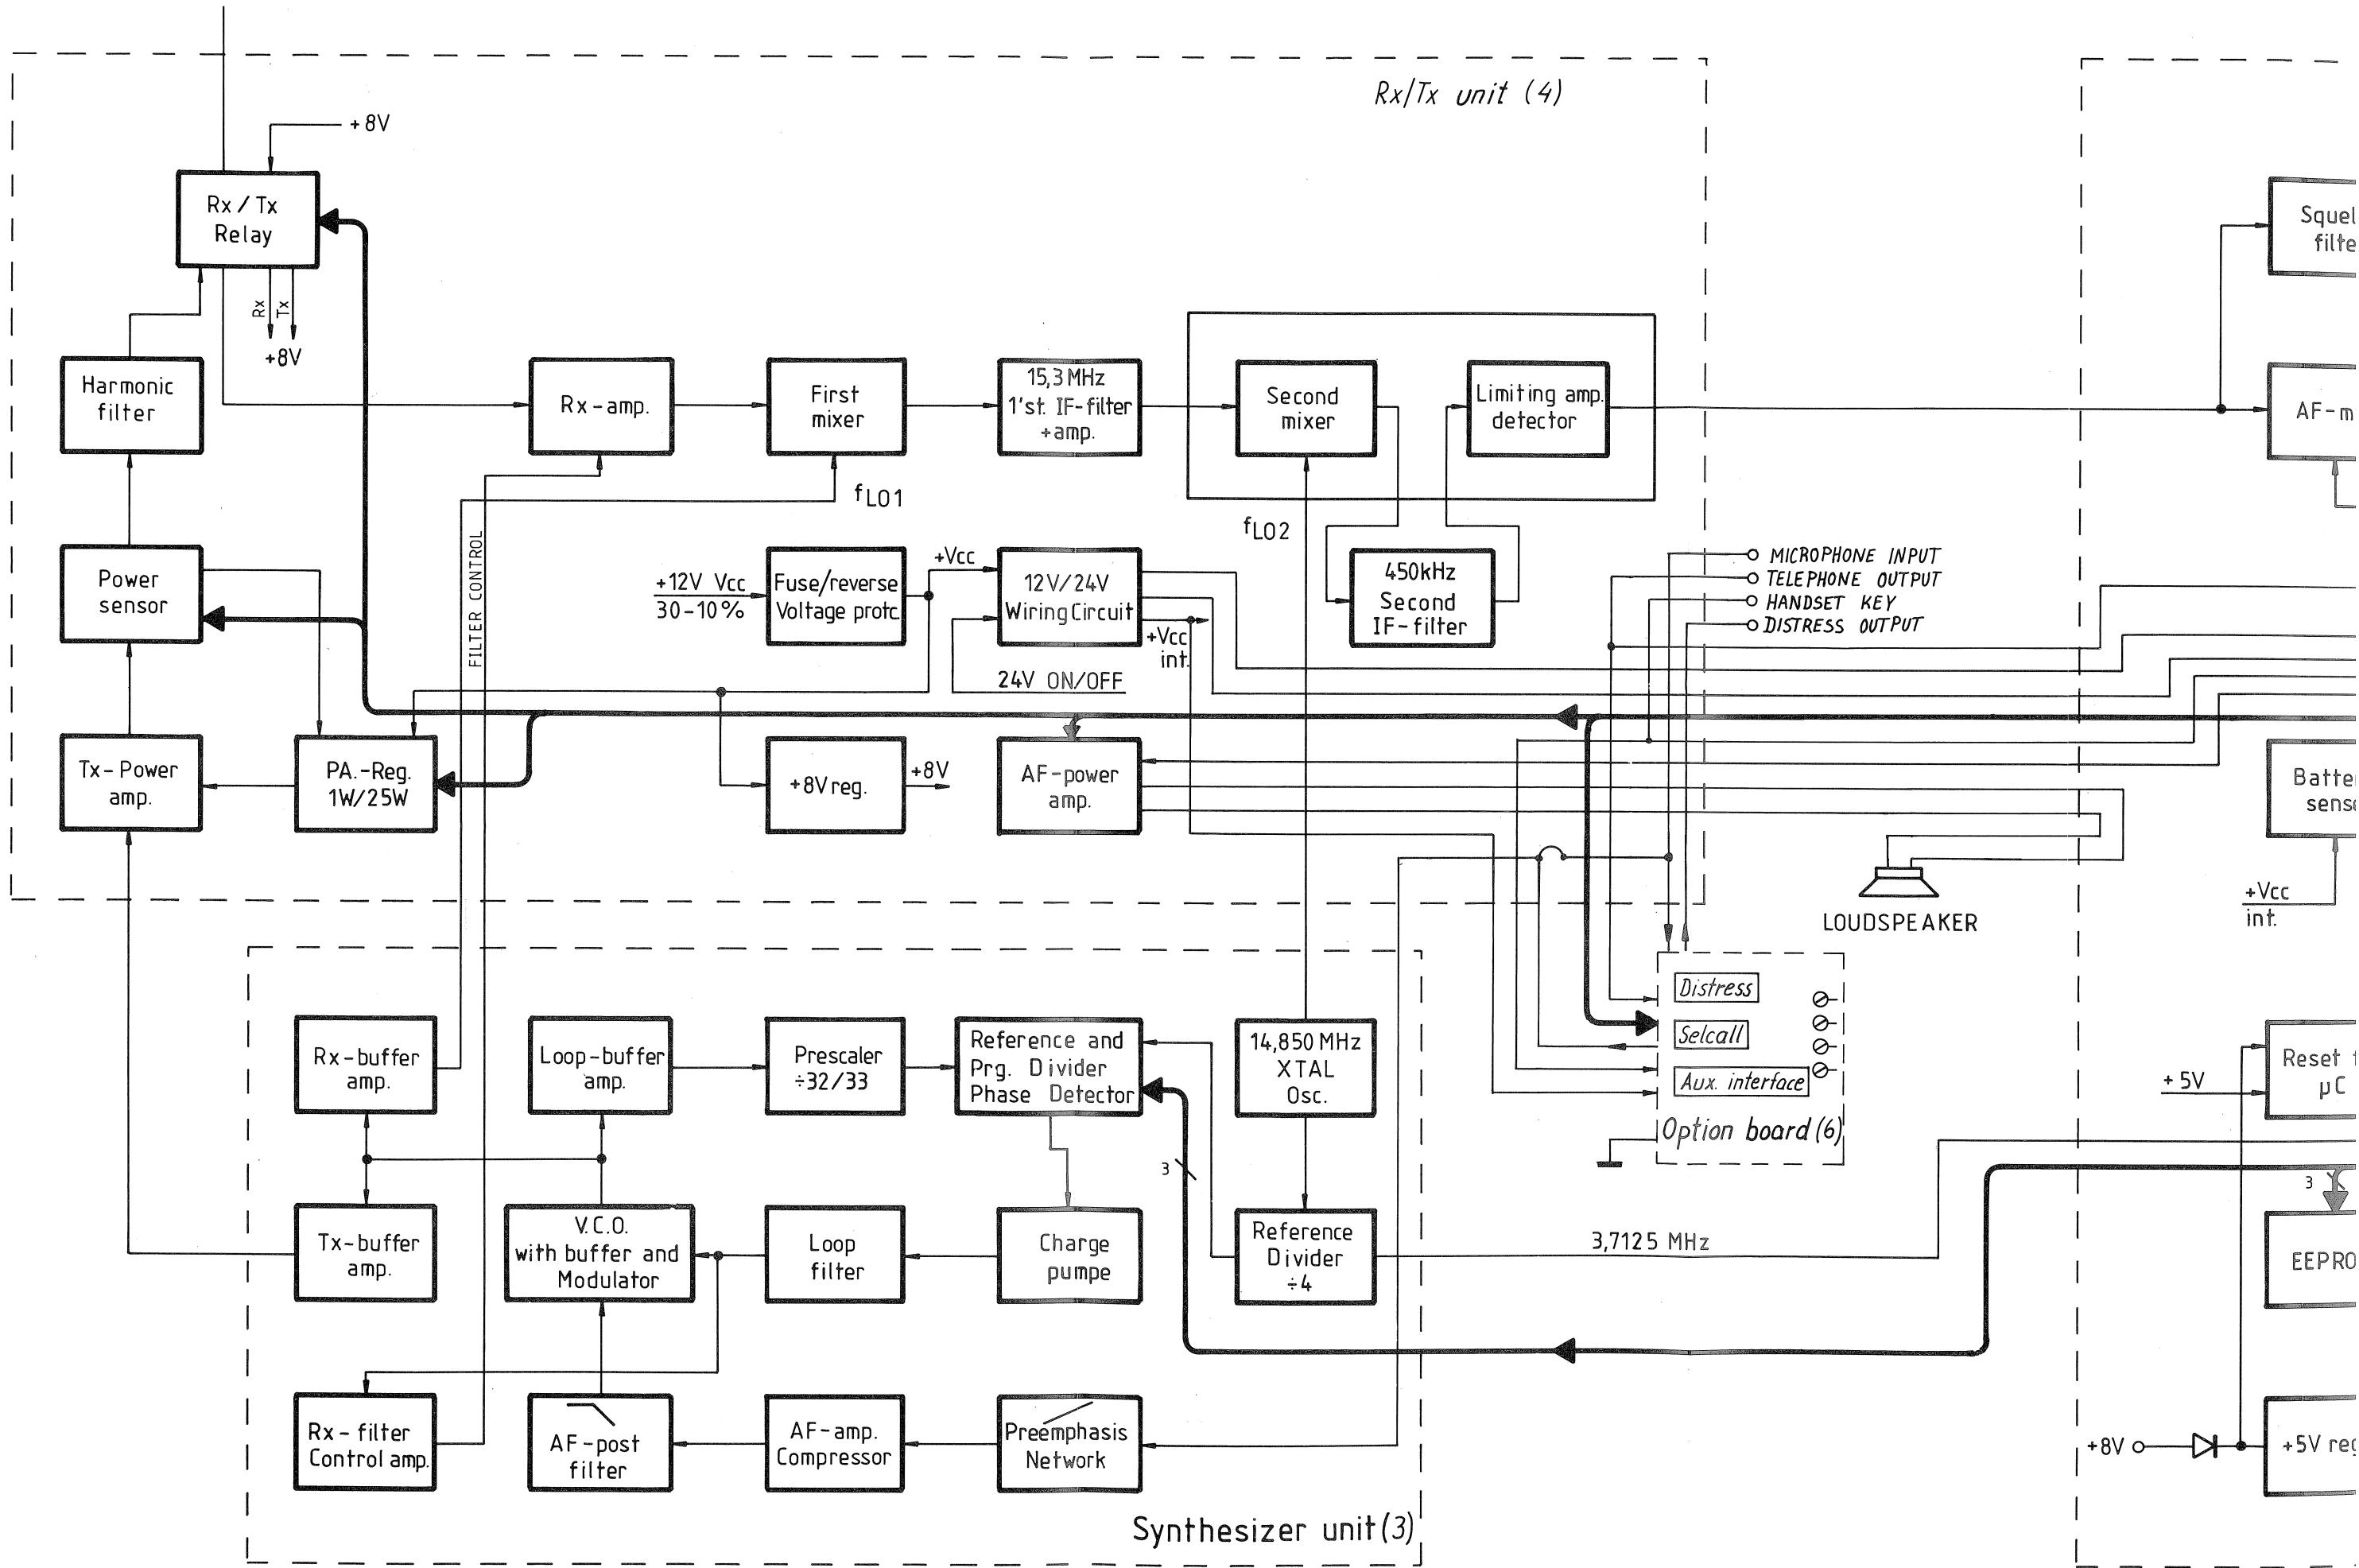

MICROCOMPUTER

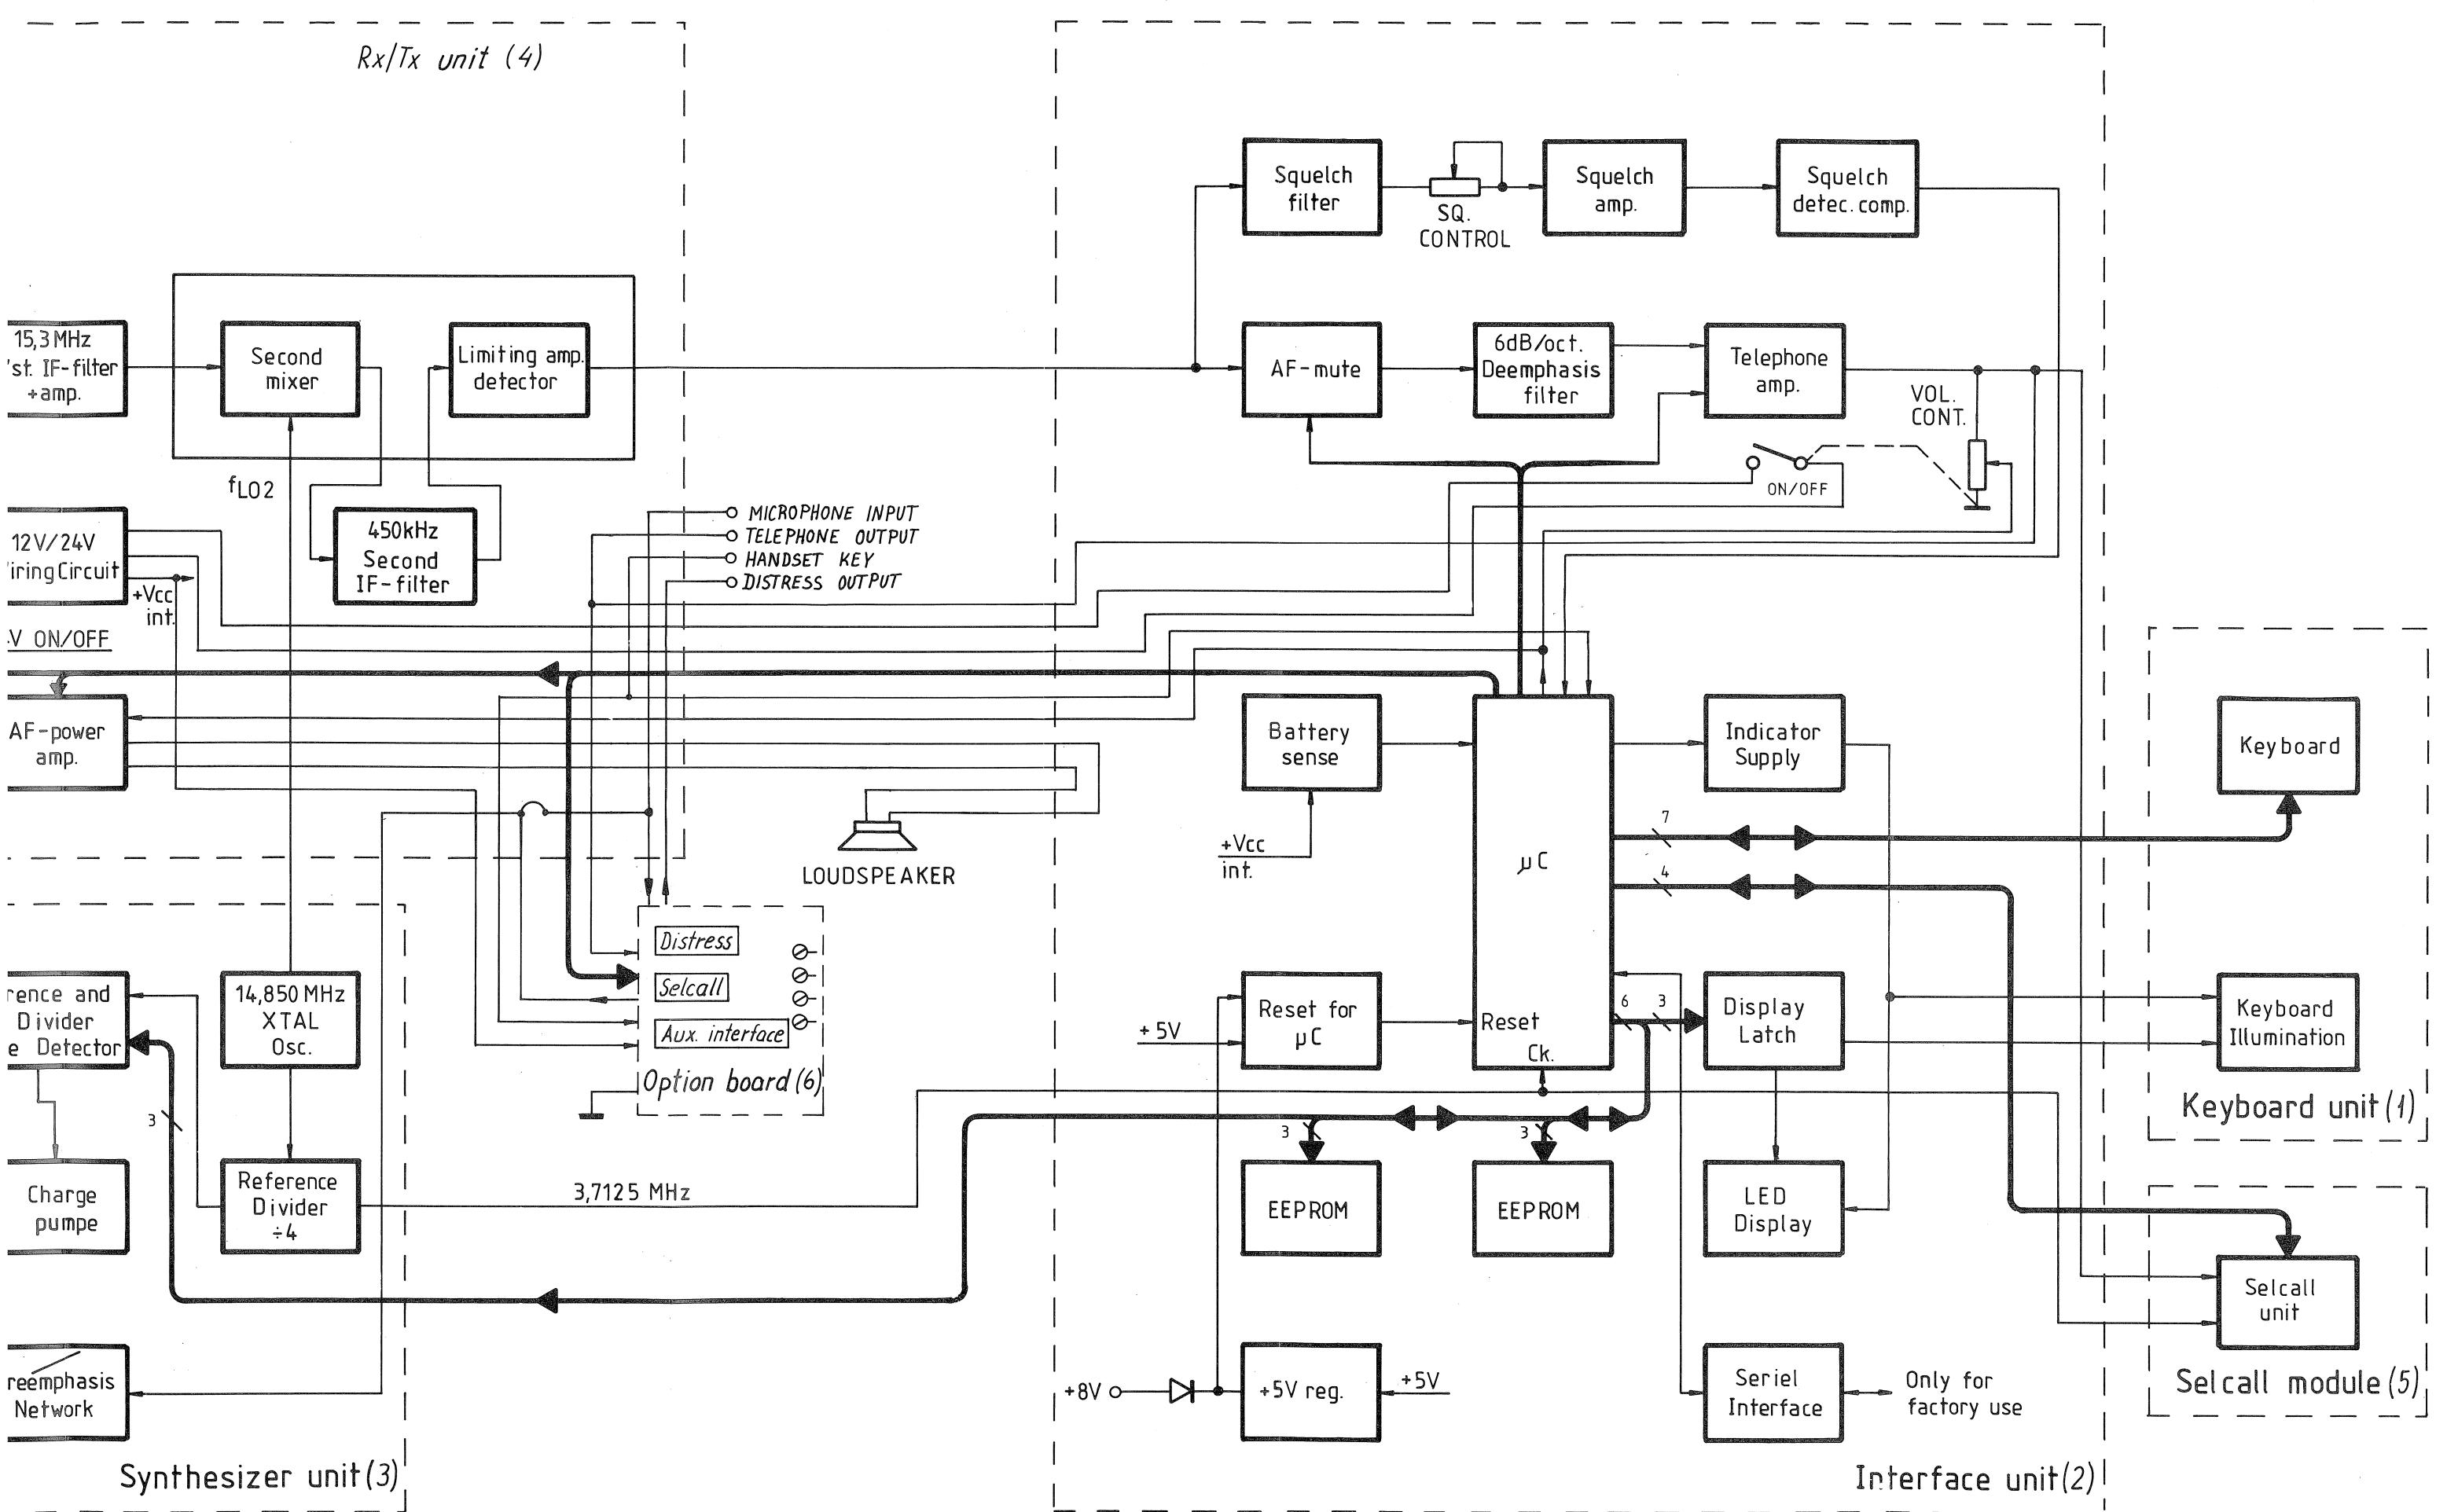

The microcomputer on the interface unit is taking care of various functions, among these the user interface, which means reading of the keyboard and readout to the LED-display via the DISPLAY-LATCHES.

Moreover the computer calculates the appropriate division figures for the PLL, controls the transmitter power level, the AF mute circuits, and reads and writes to the EEPROM's.

When a selcall unit is installed, the microcomputer also controls the selcall switch capacitor filter.

The serial interface is only for factory production use.

2. INSTALLATION

Before installation of a SAILOR VHF RT2048 the following points must be observed:

1. Which facilities have to be enabled?
Selcall, private channels, US-mode, dual watch, scanning facilities, etc. The procedure how to enable the facilities is described in the manual: INSTRUCTIONS FOR IDENTITY AND SERVICE PROGRAMMING OF SAILOR VHF RT2048.
This manual will only be delivered to dealers and general agents, where it must be at the disposal of trained service people in the service workshop.
2. In what way the VHF RT2048 has to be installed?
In the section MOUNTING POSSIBILITIES, the installation of VHF RT2048 is described either as an independent unit or in combination with the other elements of the Compact 2000 programme.
3. Handset.
Installation of handset, see the section HANDSET.
4. External loudspeaker.
An external loudspeaker 4-8 ohm/6W can be connected to the power connector J1, pin 1 and 6, see the section POWER CONNECTOR + EXT. LOUDSPEAKER.
5. Special options:
Remote alarm for selcall, AF to information decoder, AUX I and AUX II information, etc. are available, see the section SPECIAL OPTIONS.

2.1. MOUNTING POSSIBILITIES

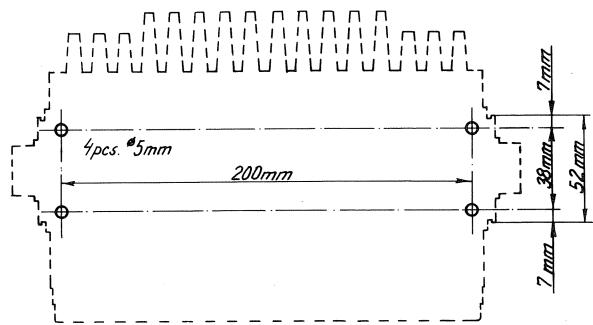

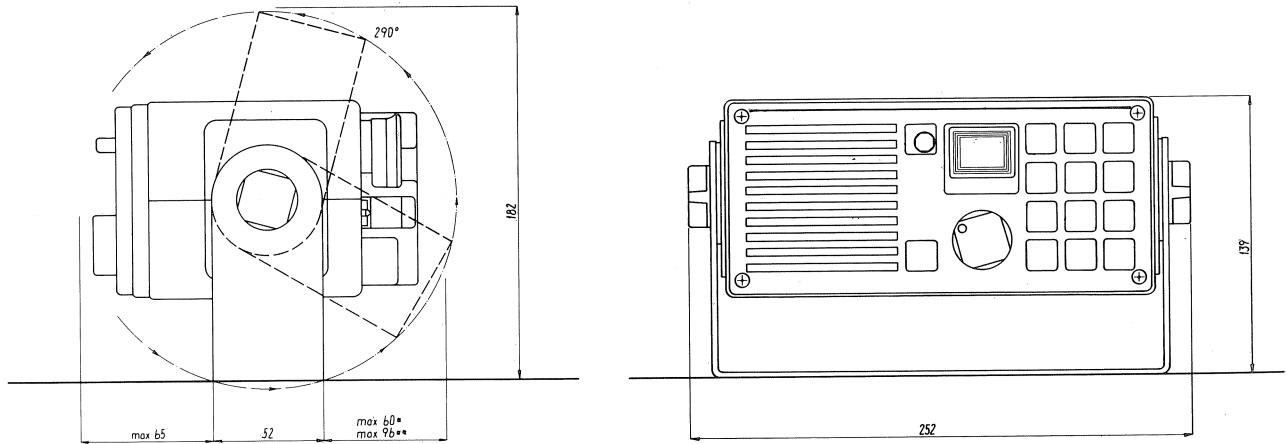

The VHF RT2048 cabinet is designed in a module called a mini 1/4 box. For this module we can supply a wide variety of installation brackets etc. which will be described below. We have made a drawing including dimensions and drilling plan for each type and we kindly ask you to look at the drawing for the type in question.

H2077 MULTI-PURPOSE MOUNTING BRACKET

This mounting bracket is as standard delivered together with RT2048. It permits a wide variety of installation possibilities such as tabletop, bulkhead or deckhead. It is easy to remove the set by unscrewing the two buttons of H2077.

H2077

RT2048 A 4-0-25572
4-0-25571
4-0-25668

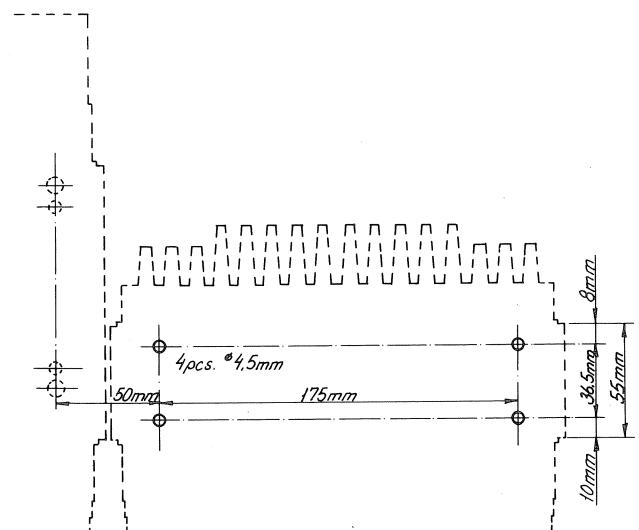

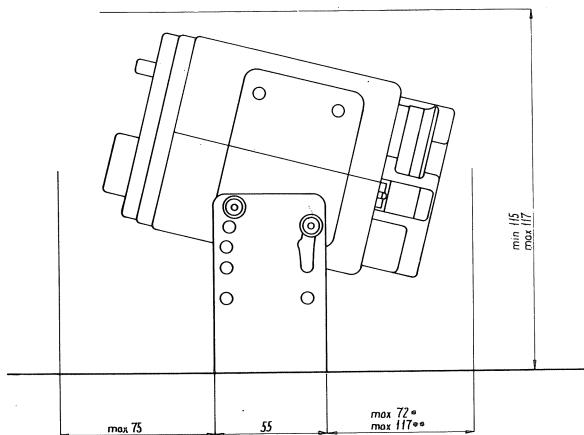

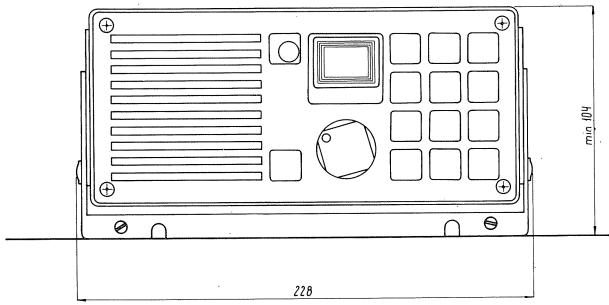

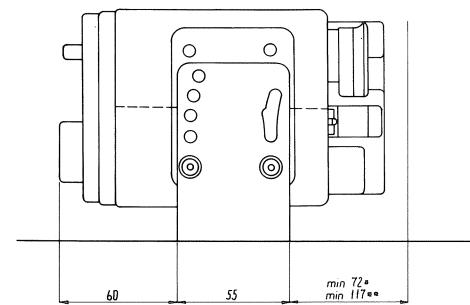

Weight:
Mounting kit H2077: 0.4 kg
VHF RT2048: 3.2 kg

2.1. MOUNTING POSSIBILITIES cont.:

H2067 MOUNTING BRACKET FOR TABLETOP, BULKEHAD OR DECKHEAD MOUNTING FOR MINI 1/4 BOX

This mounting bracket is used when RT2048 is to be mounted next to other SAILOR units in the Compact 2000 programme mounted in H2055 mounting brackets. For example when installing the RT2048 next to the scrambler CRY2001 it is possible to tilt both units in the same angle.

H2067

Weight:
Mounting kit H2067: 0.5 kg
VHF RT2048: 3.2 kg

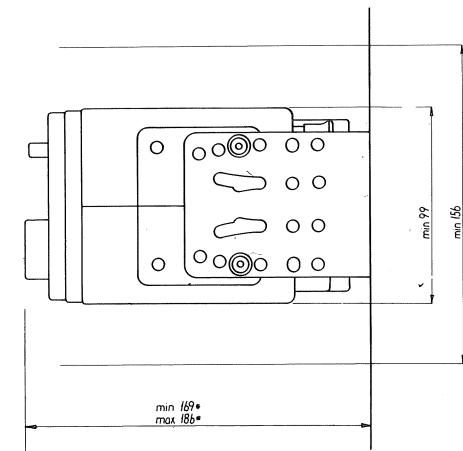

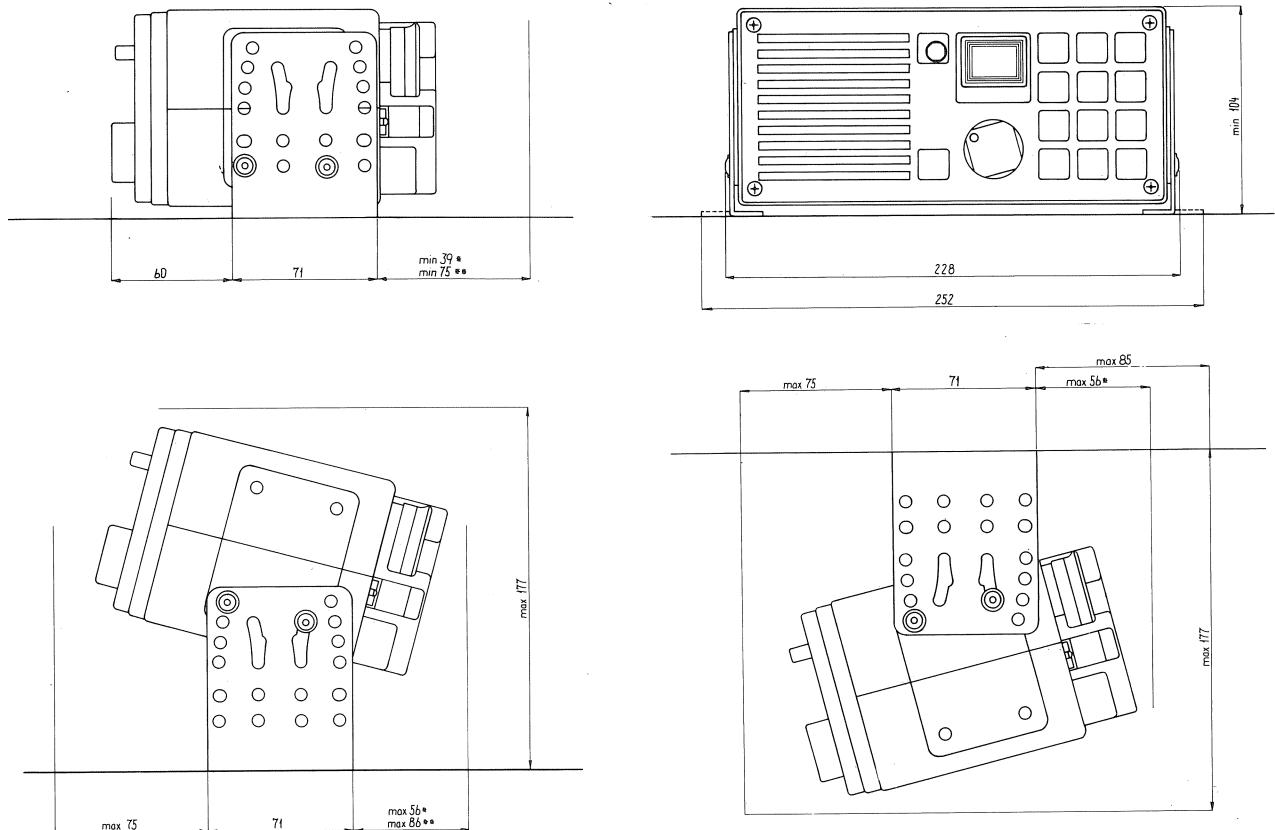

RT2048 A 4-0-25574 4-0-25573

2.1. MOUNTING POSSIBILITIES cont.:

H2057 ANGLE HINGES FOR TABLETOP, BULKHEAD OR DECKHEAD MOUNTING FOR MINI 1/4 BOX

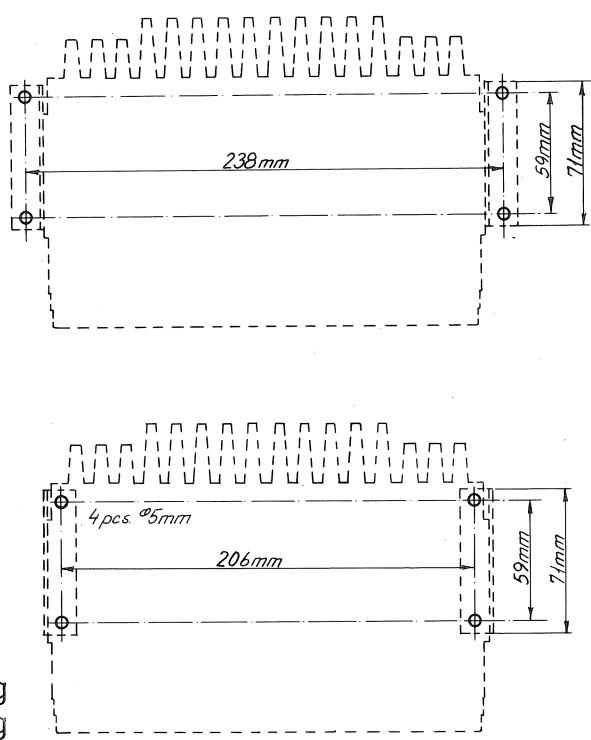

H2057 is designed for stationary installation. It offers a lot of mounting possibilities using the different holes in the angle hinges when tilting the VHF.

H2057

* Dimensions when using a right-angled VHF plug.
** Dimensions when using a standard VHF plug.

Weight: Mounting kit H2057: 0.4 kg
VHF RT2048: 3.2 kg

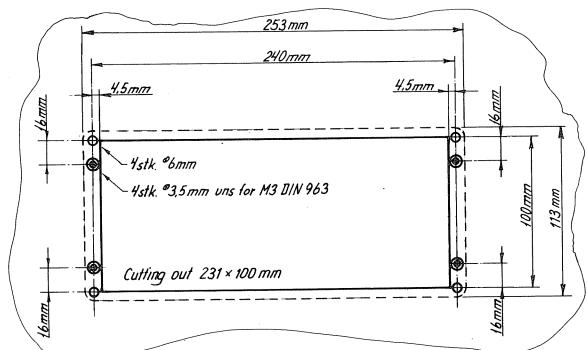

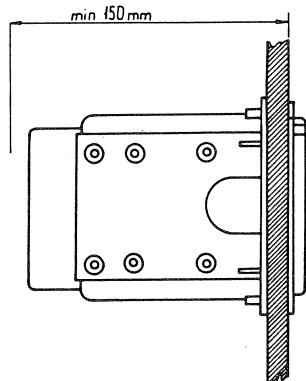

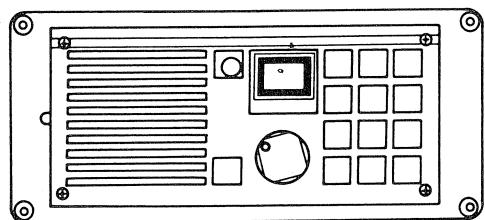

2.1. MOUNTING POSSIBILITIES cont.:

H2063 CONSOLE MOUNTING KIT FOR 1/4 BOX

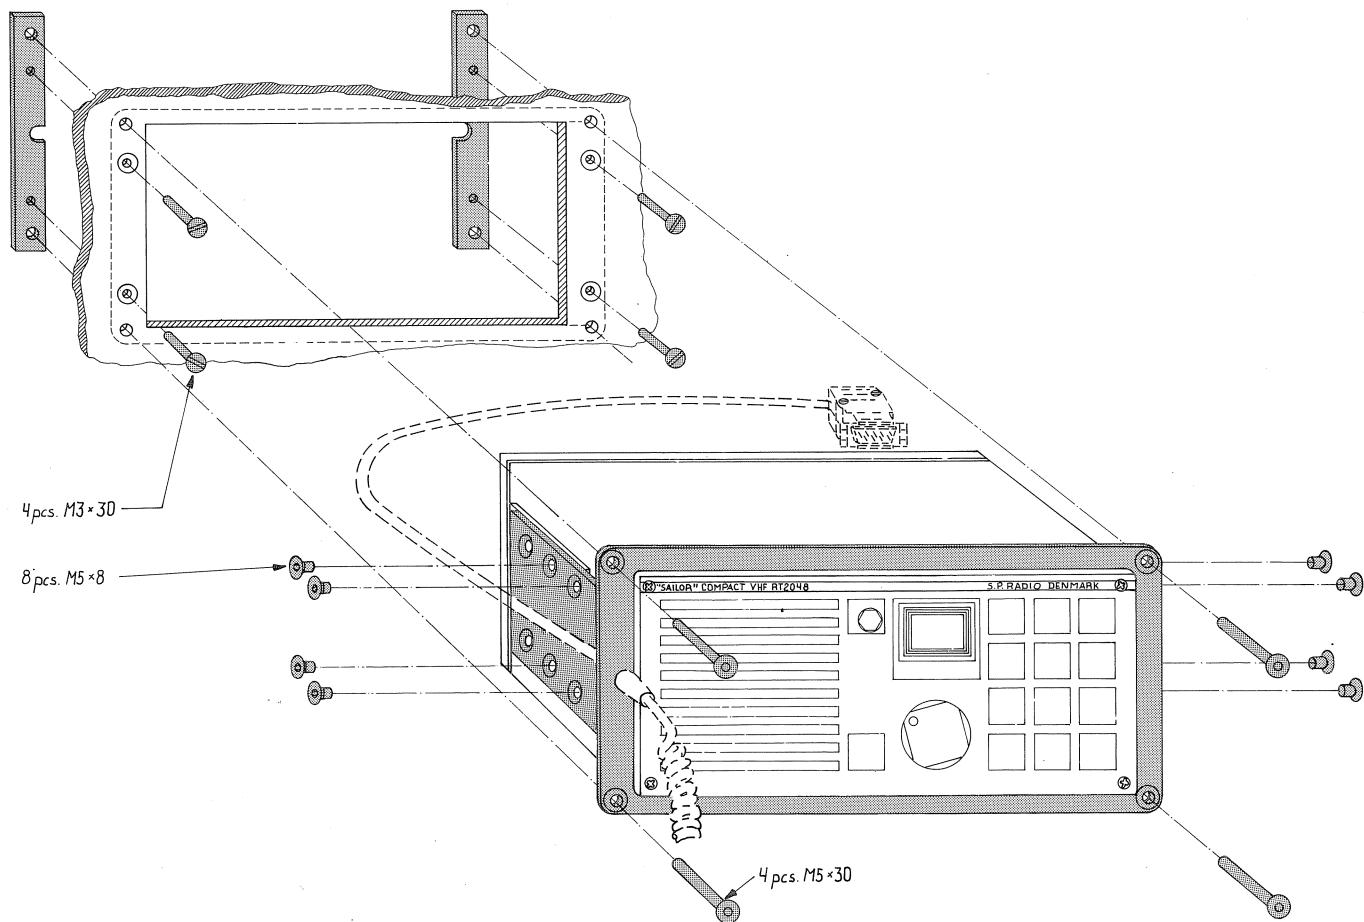

This mounting kit is used for console flush mounting of 1/4 box and mini 1/4 box.

Free distance must be kept to allow free air circulation, ambient temperature max. 40°C.

H2063

Weight:
Mounting kit H2063: 1.0 kg
VHF RT2048: 3.2 kg

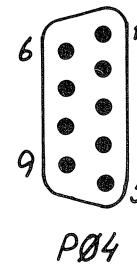

RT2048 A 4-0-25663
4-0-24703
4-0-25657

2.2. HANDSET

The handset can be placed anywhere near the VHF set. The cable is five-cored and connected to the rear of the VHF through a 9-pole Sub-D connector. Installation of the cable, see the drawings of the mounting brackets. The cable grommet must be placed in the most convenient groove in the mounting bracket.

If more than one handset is needed, please see the section SPECIAL INSTALLATION WITH 2 OR 3 MICROTELEPHONES.

2.3. MICROTELEPHONE CONNECTOR

Pin No. 1 Telephone
Pin No. 2 GND
Pin No. 3 GND
Pin No. 4 Mic
Pin No. 5 Key
Pin No. 6 Spare
Pin No. 7 Distress CRY*
Pin No. 8 "Serial input"
Pin No. 9 +13V internal

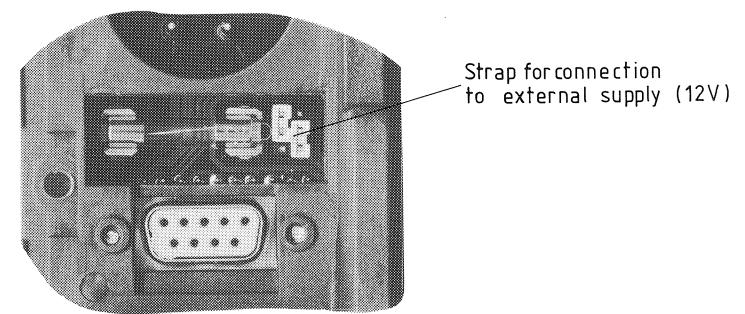

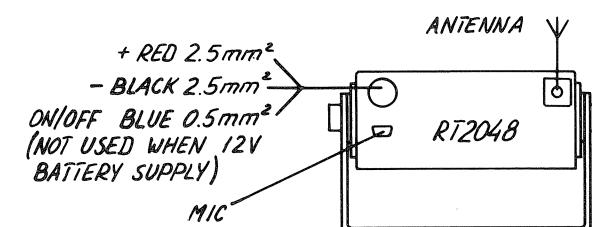

*only active when option board pcb is installed.

2.4. POWER SUPPLY

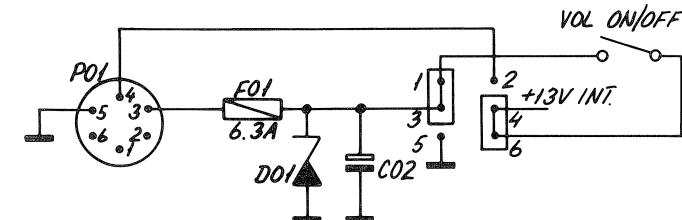

The standard power supply for RT2048 is 12V DC. For 24V DC supply an external power supply N420 (a 24V DC to 13.2V DC serial regulator) can be used.

For 110V AC, 127V AC, 220V AC, or 237V AC operation an external power supply N163S must be used together with N420.

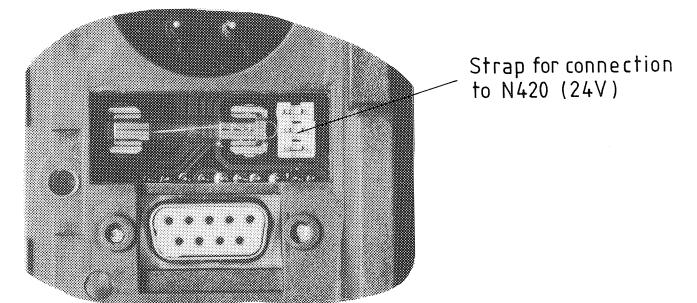

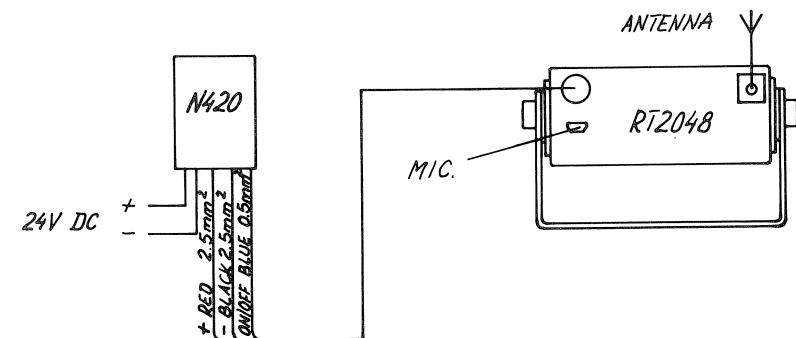

12V OPERATION

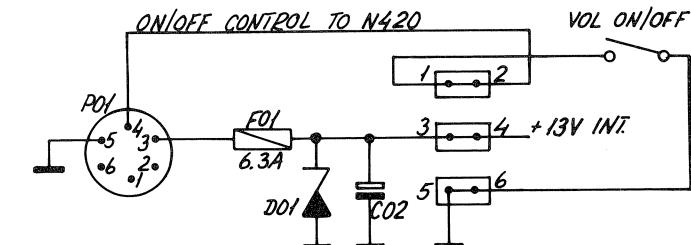

BLOCK DIAGRAM OF STRAPPING FOR 12V DC

24V OPERATION

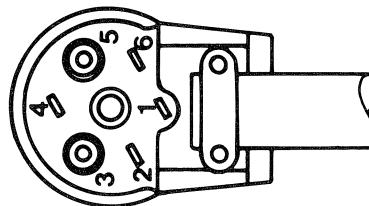

BLOCK DIAGRAM OF STRAPPING FOR 24V DC

2.5. POWER CONNECTOR + EXT. LOUDSPEAKER

VIEW FROM MOUNTING SIDE

J01

Pin No. 1 Ext. loudspeaker
Pin No. 2 Ext. mute*
Pin No. 3 +12V power supply
Pin No. 4 on/off for 24V supply
Pin No. 5 -12V power supply
Pin No. 6 Ext. loudspeaker

*only active when option board pcb is installed.

If necessary a 4-8 ohm/6W external loudspeaker can be connected to pin No. 1 and pin No. 6 in the power connector J 01 (observe that there is DC voltage on both wires).

External loudspeakers SAILOR H2054 and H2074 are available.

2.6. ANTENNAS

All common 50 ohm antennas, which cover the used frequency range with a reasonable standing wave ratio, maximum 1.5, are available.

The antenna is connected to the set by means of a 50 ohm coaxial cable with low loss, e.g. RG213U. At the cable end a PL259 plug is mounted.

The antenna must be placed as high and clear as possible. The horizontal distance to metal parts must be at least one metre.

S. P. Radio has an antenna of the necessary specifications available. The mentioned antenna is characterized by small external dimensions. For further particulars see special brochure VHF AERIALS.

2.7. SPECIAL OPTIONS

With a small modification in RT2048 the following options are available:

1. K-switch function (used on river boats in Germany). Can be enabled by means of the identity programming. US-button is changed to K-switch.
2. With DISTRESS OPTION installed
S.P. No. 625661
 - a. Distress output to CRY2001/2002.

2.7. SPECIAL OPTIONS cont.:

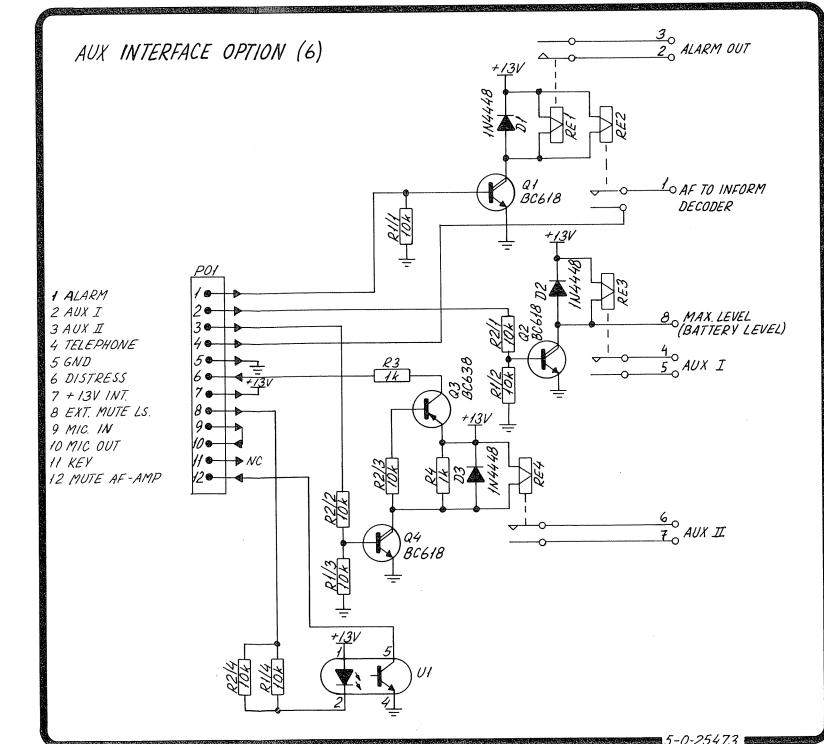

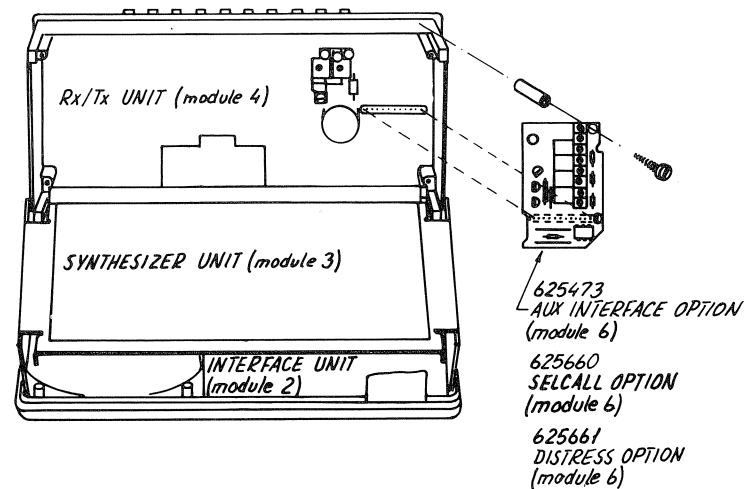

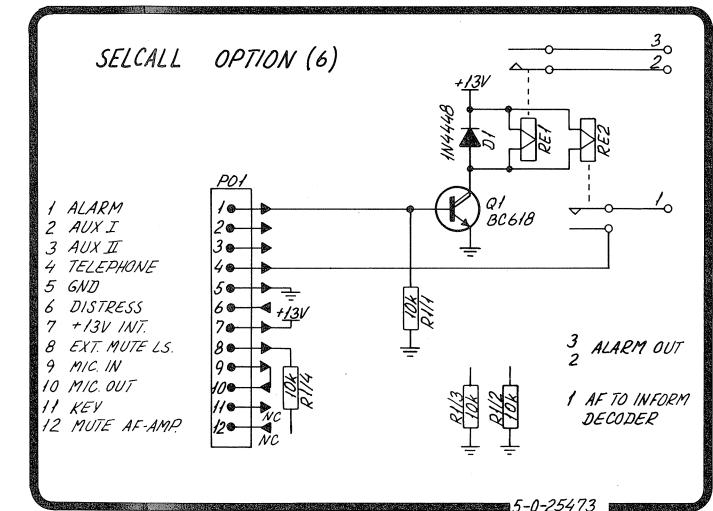

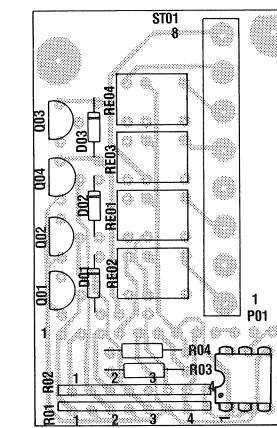

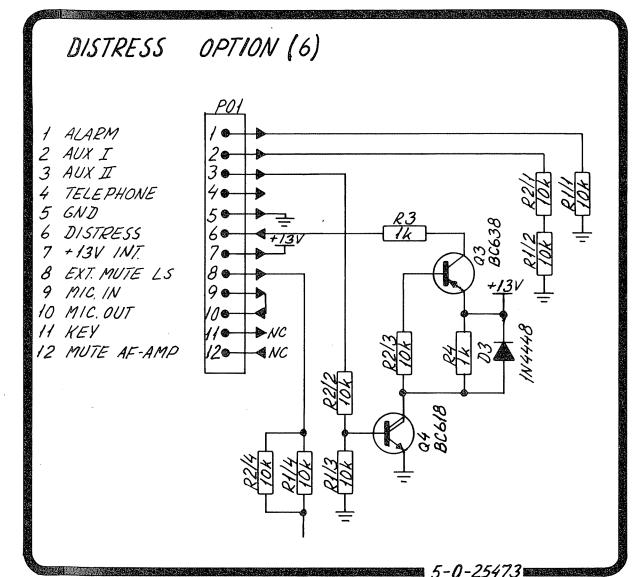

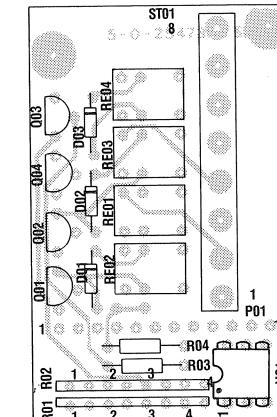

3. With SELCALL OPTION installed S.P. No. 625660

- a. SELCALL RELAY, when the selcall has accepted a CQ or an individual call signal, the selcall relay will turn on and short circuit two wires, which can be used for remote alarm. Max. contact load: 100V AC/24V DC - 2A.
- b. AF TO INFORMATION DECODER, the circuit giving AF signals to the information decoder is turned on when the set has accepted a CQ or an individual call signal. The circuit is turned on/off by the microprocessor.

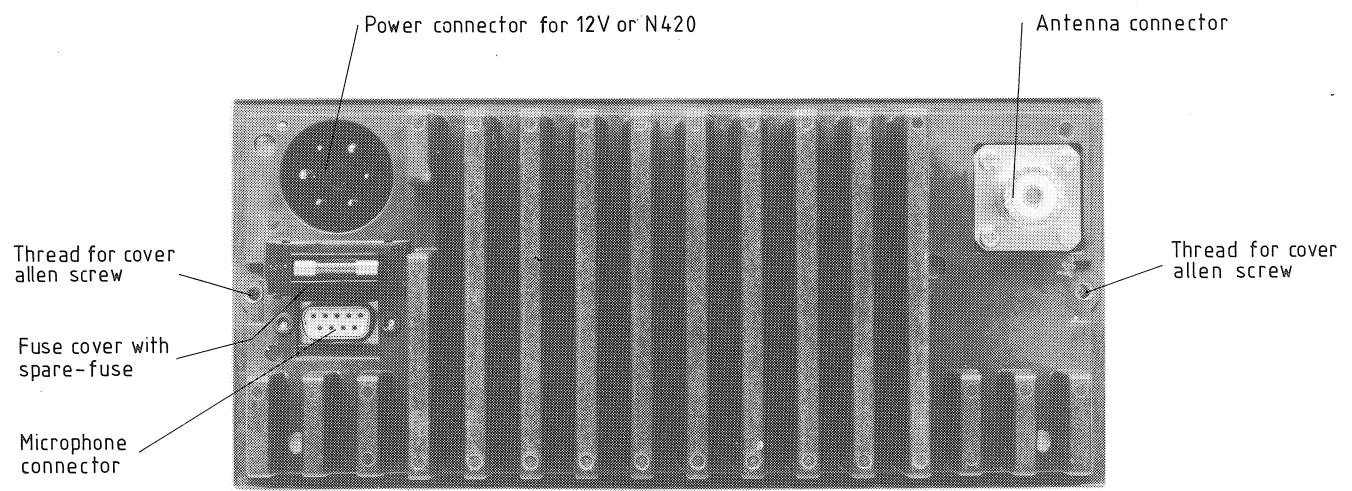

4. With AUX INTERFACE OPTION installed S.P. No. 625473

(AUX1, AUX2 and MUTE functions) (Distress and Selcall functions are also mounted)

- a. AUX2, when information on certain channels is wanted, i.e. controlling a watch keeping receiver, the AUX2 information can be used, a relay is controlled from the microprocessor. Max. contact load: 100V AC/24V DC - 2A.
- b. AUX1, when function code in Prom 1 is enabled, AUX1 is free programmable on all international channels ("0" or "1"). Standard programming on international channels is "0". Max. contact load: 100V AC/24V DC-2A.
- c. MUTE, makes it possible to mute AF power amplifier from external equipment. Activated by a make function between pin 5 and pin 8 in P1 on option board.

2.8. REAR VIEW OF VHF RT2048

3. SERVICE

3.1. MAINTENANCE

PREVENTIVE MAINTANANCE

If SAILOR RT2048 has been installed in a proper way the maintenance can be reduced to an overhaul at each visit of the service staff. Then inspect the set, the antenna, cables, and plugs for mechanical damages, salt deposits, corrosion, and any foreign material. Owing to its traditional structure, the SAILOR RT2048 has a long lifetime, but it must always be carefully checked at intervals not exceeding 12 months - dependent on the conditions under which the set is working. The set must be brought to the service workshop to be tested.

Along with each set a TEST-SHEET is delivered in which all the measurements, made in the test department of the factory, are listed. If the control measurings made in the service workshop should not show the same values as those listed in the test-sheet, the set must be adjusted as specified in the ADJUSTMENT PROCEDURE.

3.2. ALIGNMENT INSTRUCTIONS

INTRODUCTION

The measuring values indicated in paragraph 2 of CIRCUIT DESCRIPTION AND SCHEMATIC DIAGRAMS are typical values and as indicated it will be necessary to use instruments in absolute conformity with the below list:

3.3. PROPOSAL FOR NECESSARY MEASURING INSTRUMENTS

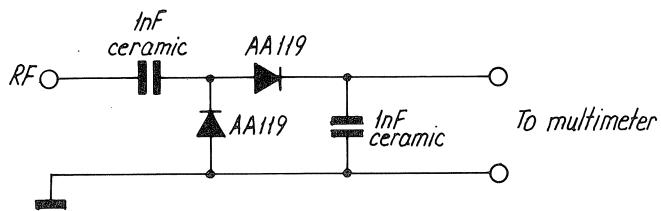

VHF Signal Generator type TF2015	MARCONI
FM Modulation Meter type TF2303	MARCONI
Distortion Analyzer type TF2337A	MARCONI
AF Voltmeter type VT-121	TRIO
Tone Generator type PM5107	PHILIPS
Electronic Multimeter type PM2505	PHILIPS
RF Directional Wattmeter Model 43	BIRD
50W Load with 30 dB Attenuator type 8321	BIRD
Frequency Counter:	
Frequency range	>175 Mhz
Sensitivity	<100 mV
Impedance	>1 Mohm and 50 ohm
Accuracy	<1 · 10 ⁻⁶

3.3. PROPOSAL FOR NECESSARY MEASURING INSTRUMENTS cont.:

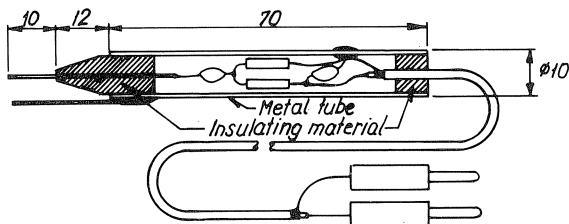

We can also recommend one of the new communication test sets introduced by several instruments manufacturers.

From S. P. Radio this high quality product will be tested and adjusted by means of a CMT communication tester from Rohde and Schwarz.

3.4. TEST PROBE

LAYOUT OF THE PROBE

All measurings made by means of a test probe will be relative measurements. For quantitative measurings the diode probe should be calibrated by means of a signal generator at a certain impedance level (50 ohm) as a function of frequency.

3.5. ADJUSTMENT PROCEDURE

3.5.1. ADJUSTMENT OF SYNTHESIZER UNIT

Alignment of Frequency Generator and RF-Levels.

1. Connect a frequency counter to the TX-driver output of J4.
2. Select channel 6 and key the transmitter.
3. Connect a DC-voltmeter to the point between R50 and R95 and adjust L9 until the reading is 2.0V.
4. Adjust the frequency on C77 until the counter read-out is 156.300000 MHz ± 150 Hz.
5. Connect a power meter to the TX-driver output at J4 and adjust the output level to minimum at R98.
6. Now the windings on coils L14, L13, and L12, L11, L10 are moved a little bit to obtain maximum output at J4.
7. If the output level is below 200 mW, the level is raised by means of R98 until the power meter reading is 200 mW.
8. Release the transmitter key; the set should still be on channel 6.
9. Connect a DC-voltmeter to the point between R50 and R95 and adjust C78 until the reading is 2.0V.
10. Check the RF-output level from the RX-buffer amplifier at J3. The level should be 5 mW -1 dB, +3 dB.

Alignment of Modulation Circuitry.

1. Connect a modulation meter to the TX-driver output at J4, and a distortion meter to the AF-output part on the modulation meter.
2. Connect tone generator and AF-voltmeter between pin 4 in the connector for handset and ground, pin 3.
3. Select channel number 6 and key the transmitter.
4. Turn potentiometer R97 fully clockwise.
5. Set the tone generator to a frequency of 1000 Hz and output level to 100 mV_{RMS}
6. Adjust R96 to nominal modulation: $f = \pm 3$ kHz and check that distortion is less than 5%
7. Raise tone generator output level to 1.0 V_{RMS}
8. Adjust R97 to maximum deviation: $f = \pm 4.8$ kHz.

3.5.1. ADJUSTMENT OF SYNTHESIZER UNIT cont.:

Alignment of RX-Filter Control Amplifier

1. The receiver must be tuned up according to the TUNE-UP PROCEDURE.
2. Select channel 28.
3. Connect signal generator to antenna connector J04.
4. Connect test probe to pin 16 at U03 on the RX/TX board.
5. Set signal generator frequency to 162.000 MHz and output level to -30 dBm.
6. Adjust R95 until maximum output level from the test probe is reached.

3.5.2. ADJUSTMENT OF RX/TX UNIT

Alignment of Internal Power Supply

1. Select channel 6.
2. Select 1W output level and key the transmitter.
3. Connect a DC-voltmeter to the test point at the output of U01.
4. Adjust the output voltage to 8V \pm 50 mV by means of potentiometer R04.

Alignment of RF and IF Amplifier

1. Select channel 6.
2. Connect signal generator to antenna connector J04.
3. Connect test probe to pin 16 on U03.
4. Set signal generator frequency to 156.300 MHz and the output level to -30 dBm.
5. Adjust transformers TR01, TR02, and coils L10, L11, L12, and L09 to maximum deflection on the TP-meter.

Alignment of Detector and AF-Output Level

1. Select channel 6.
2. Connect signal generator to antenna connector J04.
3. Connect frequency counter between pin 3 of U03 and frame through a 10 μ F capacitor.
4. Set signal generator level to -30 dBm (no modulation).
5. Set signal generator frequency until frequency counter shows 450.0 kHz \pm 100 Hz.

3.5.2. ADJUSTMENT OF RX/TX UNIT cont.:

6. Set modulation on signal generator to nominal modulation $f_m = 1$ kHz,
 $f = \pm 3$ kHz.
7. Connect AF-voltmeter to the AF output at pin 11 on U03.
8. Adjust coil L06 to maximum deflection on the AF-voltmeter.
9. Adjust potentiometer R20 to $250 \text{ mV}_{\text{RMS}} \pm 10 \text{ mV}_{\text{RMS}}$ on AF-voltmeter.
10. Connect distortion analyzer to the telephone output at pin 1 on P04.
11. Make sure that distortion is minimum by slightly tuning transformer TR01.
12. Check that distortion is below 5%.

Control of Receiver Sensitivity

1. Select channel 6.
2. Connect signal generator to antenna connector J04.
3. Connect distortion analyzer to the telephone output at pin 1 on P04.
4. Set signal generator to best sensitivity.
5. Check that the sensitivity is better than 0.5 uV EMF for 12 dB SINAD.
6. Repeat on channel 28.

Alignment of Transmitter Output Level

1. Connect RF-power meter and a 50 ohm 25 Watt load resistor to antenna connector J04.
2. Select channel 6 and key the transmitter.
3. Adjust potentiometer R21 until the reading is 25 Watt.
4. Set the output level to 1W.
5. Adjust potentiometer R19 until the reading is 0.8 Watt.

3.6. TROUBLE-SHOOTING

Trouble-shooting should only be performed by persons with sufficient technical knowledge, who have the necessary measuring instruments at their disposal, and who have carefully studied the operation principles and structure of SAILOR RT2048.

The first thing to check is whether the fault is somewhere in the antenna circuit, the power source, the handset, or in the transmitter - receiver unit.

In order to help you during trouble-shooting, the section 5. CIRCUIT DESCRIPTION contains diagrams, principal descriptions, and drawings showing the location of the individual components. Typical values for the DC and AC voltages are indicated in the diagrams, and also the test points are indicated in the diagrams.

SAILOR RT2048 has a number of trimming cores and trimmers, which must not be touched unless adjustments as specified in section 3.5. ADJUSTMENT PROCEDURE can be made.

When measuring in the units, short-circuits must be avoided as the transistors would then be spoiled.

3.7. REPLACEMENT OF COMPONENTS

When replacing transistors, diodes, resistors, capacitors and similar components you must use a small "pencil" soldering iron of 30 to 75 Watt rating. The soldering must be performed rapidly to avoid over-heating, and the use of a tin sucker is recommended, as otherwise there is a risk that both the components and the printed circuit will be spoiled.

3.8. REPLACEMENT OF MODULES

If a fault has been found in a module, it may often be worth-while to replace it and then repair it later on.

3.9. NECESSARY ADJUSTMENTS AFTER REPLACEMENT OF MODULE

3.9.1. REPLACEMENT OF RX/TX UNIT

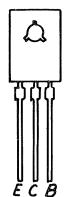

1. If a factory adjusted and tested module has to be inserted,-just proceed with point 3.
2. Follow the procedure described in section 3.5.2. ADJUSTMENT OF RX/TX UNIT.
3. Follow the procedure Alignment of RX-filter control amplifier described in section 3.5.1. ADJUSTMENT OF SYNTHESIZER UNIT.

3.9.2. REPLACEMENT OF SYNTHESIZER UNIT

1. If a factory adjusted and tested module has to be inserted, just proceed with point 3.
2. Follow the procedure described in section 3.5.1. ADJUSTMENT OF SYNTHESIZER UNIT.
3. Follow the procedure Alignment of RX-filter control amplifier described in section 3.5.1.

5. CIRCUIT DESCRIPTION

5.1. KEYBOARD UNIT (MODULE 1)

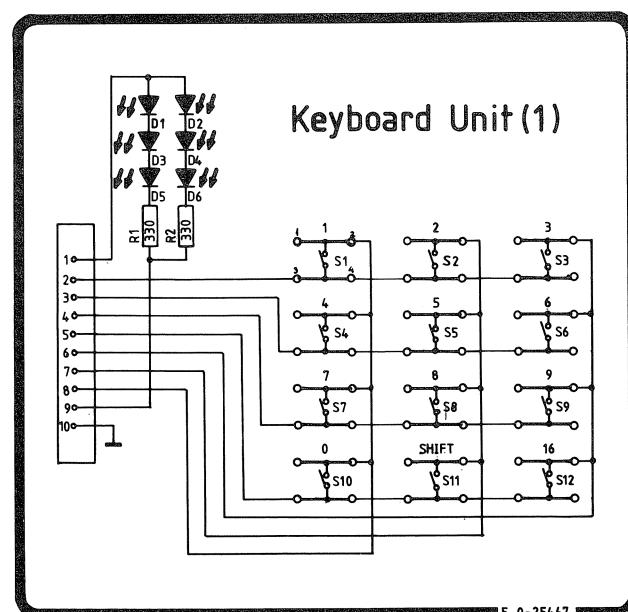

The keyboard unit comprises the 3 point 4 push button matrix, which is used for all the entries from the front panel e.g. channel selection, 1W etc. Besides the LED-diodes for keyboard illumination is placed on this board.

KEYBOARD (MODULE 1)

RT2048 A
4-6-25447A 4-0-25447

5.2. INTERFACE UNIT (MODULE 2)

5.2.1. +5V POWER SUPPLY

The internal power supply for the logic circuitries is generated from the internal +8V power supply, by means of the integrated voltage regulator U09. The input voltage for U09 is fed to pin 3 via D01, which secures an appropriate voltage decay on C12 when the set is switched off.

5.2.2. BATTERY SENSE/RESET CIRCUIT

When the set is switched on, U07/1 which is coupled as a comparator will generate an appropriate reset signal for the microcomputer U03. U07/2 is configured as a comparator circuit sensing the level of the internal +13V supply voltage. When this voltage drops below a certain level determined by R27, R20, R54, and D11 a "voltage low" signal is generated on pin 1. This action is detected by the microcomputer U3 which in turn will block the key function.

5.2.3. INDICATOR SUPPLY

The LED read-out intensity is controlled by means of a four-step voltage supply. Transistor Q02 acts as the emitter follower buffer transistor. The base voltage level of this transistor, and so the output voltage, is controlled by means of U08/4 and the programming resistors R07, R49, R47, and R55.

5.2.4. DISPLAY LATCHES

The display segments and the display power supply control inputs are buffered by means of three serial to parallel registers included in the integrated circuits U04, U05 and U06. The information is latched-in by means of the internal serial data bus controlled by the microcomputer.

5.2.5. READ-OUT

The information read-out is made by means of two seven-segment LED-displays D06, D07 and three individual diodes for 1W, TX and US-mode D03, D10, and D12.

5.2.6. EEPROM-MEMORIES

The two IC's U01 and U02 constitute the internal programmable memory. These circuits are controlled by the microcomputer via the internal serial bus. The memories are used for set identification codes, private channel programming etc.

5.2.7. MICROCOMPUTER

All the internal control signals are supplied by the microcomputer U03, either by means of the internal serial bus or by individual control signals

5.2. INTERFACE UNIT (MODULE 2) cont.:

like the key function, power level etc. Besides the microcomputer reads the keyboard information via the connector J01.

When a selcall unit is installed via J02, the control functions for this module and the alarm generation are created by the microcomputer. The audible alarm is coupled to the loudspeaker by means of resistors R26, R40, and R46.

5.2.8. SERIAL INTERFACE

For use in the factory production, a serial interface to the microcomputer is implemented by means of U07/4 and transistor Q01.

5.2.9. SQUELCH

The AF signal from the discriminator amplifier on RX/TX board is fed to the active squelch filter around U08/2, which is a highpass filter with a roll-off frequency of 45 kHz. The signal is amplified about 6-8 dB.

The amplitude of the noise signal is adjustable from the front panel by means of the squelch potentiometer R10.

Q05 amplifies the signal to the squelch detector. If there is a noise signal (without carrier at the receiver), the detector generates a DC voltage at pin 9 on U08/3. When this voltage increases to 0.6V, which is the same as the voltage at pin 10 on U08/3, the comparator output goes low and the squelch mute message is generated via Q08.

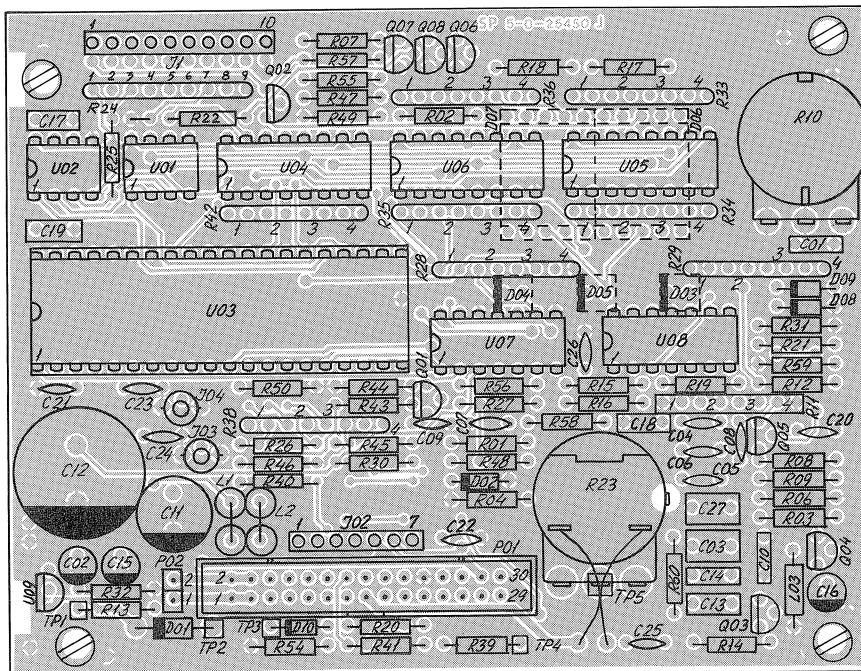

The microcomputer U03 detects the message and generates the appropriate mute signals for the AF amplifiers.

5.2.10. AF FILTER/AMPLIFIER

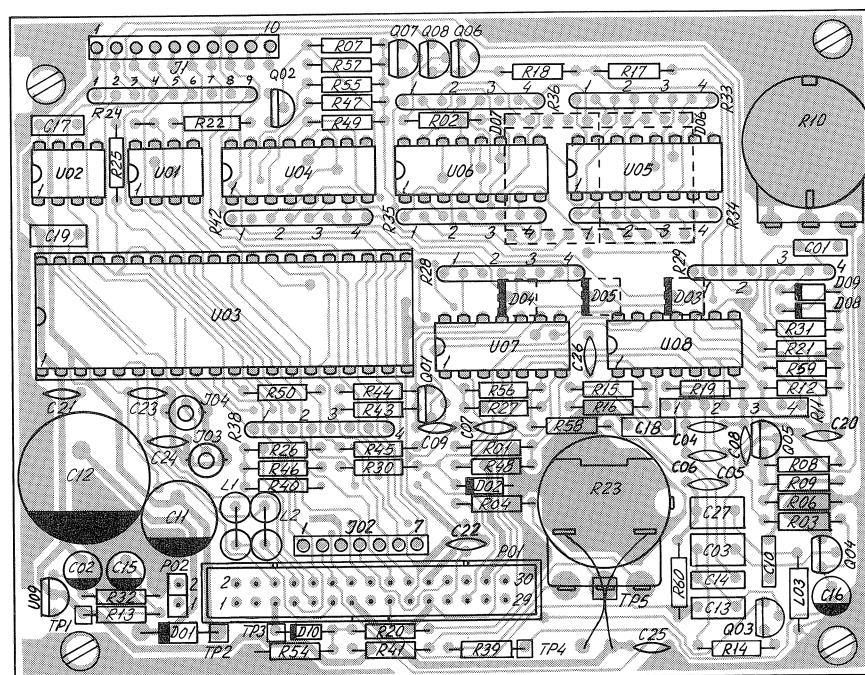

The AF signal is led to the active filter around U08/1. The filter provides a frequency response of -6 dB/oct. in the range of 0.3 to 3 kHz, and limits the signals outside this range.

Q04 is an emitter follower buffer amplifier, which supplies the earphone and the AF power amplifier. The uC controls the mute function via Q06 and Q03. When Q06 is off the DC voltage at pin 3 and 1 is 8V and therefore Q04 is off.

The loudspeaker level is adjustable by means of the volume control R23.

5.3. SYNTHESIZER UNIT (MODULE 3)

5.3.1. VCO with Buffer

The voltage controlled oscillator, built around the Field Effect Transistor Q18, is oscillating either on the transmitting frequency or on the first receiver local oscillator frequency, which means the receiving frequency less 15.3 MHz. To reach this function, the oscillator is implemented with a bandshift by means of the bandswitch diode D6 and the two capacitors C47 and C78.

In transmit mode, where the diode D6 is reverse biased, the oscillating frequency is mainly determined by C48, L9, C49, C51, and D9.

In receiving mode the oscillator resonance frequency is lowered 15.3 MHz by switching D6 on and thus putting C47 and C78 in parallel with C48.

The oscillating frequency is varied by means of the control voltage fed to the capacitor diode D9.

The output voltage from the VCO is taken via a capacitive tap C52, C53 on the source of Q18 and fed to the common buffer amplifier, built around Q15. The power gain of this stage is adjusted by means of potentiometer R98. The gain is adjusted so that the output level from the TX buffer amplifier is 200 mW measured at the output connector J4.

5.3.2. Loop Buffer Amplifier

The output from the common VCO buffer is fed to the divider chain via the stage around Q7, which secures the needed amplification and the reverse isolation between the digital parts and the VCO.

The amplifier is a fixed tuned broad band amplifier with L1, C24, and R47 forming a low Q tuned circuit.

5.3.3. 32/33 Prescaler

The integrated circuit U4 is a two modulus prescaler based on the ECL technique.

From the control logic in the programmable divider U3 pin 12, a high or low level is led to the prescaler U4 pin 1. A high level at U4 pin 1 causes the prescaler to divide by 33 and in turn a low level at pin 1 sets it up for dividing by 32.

The resistor R20 and the diode D4 work as a speed-up and overdrive protection circuit.

5.3.4. Reference/Programmable Divider and Phase Detector

The integrated circuit U3 comprises both a programmable divider for the reference input and a programmable divider with control logic for use in conjunction with a dual modulus prescaler. Besides, the IC includes two phase detectors and a lock detector of which only one of the phase detectors is in use, the output pins located at pin 15 and pin 16.

Both dividers are programmed via the serial bus from the microcomputer. The coding structure of the serial data stream includes the needed information for the on-chip decoder to detect the kind of the reached division figures. The reference division ratio is constant as the input of 3.7125 MHz is derived from the X-tal oscillator.

5.3. SYNTHESIZER UNIT cont.:

In the beginning of a counting period the prescaler U4 starts dividing by 33. After a few counts the modulus control pin changes level and the prescaler will finish the dividing cycles with a division ratio of 32, ending up with the correct total division ratio.

The pulse frequency out of the reference divider is 12.5 kHz. If the VCO frequency is correct the pulse frequency from the variable divider is also 12.5 kHz and in phase with the pulse from the reference divider. The on-chip phase detector compares the phase of the two pulses. If they are out of phase the detector creates correction pulses to the Charge Pumpe for correction of the VCO frequency/phase.

However, the synthesizer circuit is made with a small constant phase error, forced by the current drawn through R58, to avoid phase detector non linearities to degrade the loop performance. So the phase detector is sending small correction pulses to transistor Q4 with a frequency of 12.5 kHz.

5.3.5. Charge Pumpe

The charge pumpe, mainly consisting of Q4, Q5, and D2, converts the pulse with modulated phase detector outputs of U3 pin 15 and 16 to a DC current flowing into or out of the loop amplifier.

Assume that the VCO frequency has decreased from its nominal value. The phase detector will produce a negative correction pulse on pin 16, turning Q5 on, resulting in current being drawn out of the loop amplifier.

This action will cause the output voltage to increase, thus increasing the VCO frequency to the nominal value.

An increase in VCO frequency from its nominal value will in turn cause a correction pulse on pin 15, turning Q4 off, resulting in current flowing into the loop amplifier through the diode D2. This means the output voltage will decrease, forcing the VCO frequency to decrease.

Because of the current drawn through R58, a small correction pulse of about 500 nsec will always be present at pin 15 on U3 with a frequency of 12.5 kHz.

5.3.6. Loop Amplifier/Filter

The loop amplifier is realized as a discrete operational amplifier with transistors Q10 and Q11 forming the input differential pair and Q8, Q9 the output stage.

The loop dynamic performance is mainly controlled via the feed-back components in the loop amplifier, this means capacitors C29, C30, C31 and R49. The output from the loop amplifier is further filtered in a low pass filter formed by C36, L2, C34, and C35, to reduce the level of the reference frequency sidebands on the VCO output.

5.3.7. RX Buffer Amplifier

When receiving, the bandswitch diode D8 is turned on, and the output from the VCO buffer amplifier is further amplified in a single tuned amplifier formed around Q16 with L8, C70, and C73 forming the tuned circuit. The output is attenuated and impedance matched by means of resistors R93 and R94. The typical output level at connector J3 will be 5 mW.

5.3. SYNTHESIZER UNIT cont.:

5.3.8. TX Buffer Amplifier

When the set changes to transmit mode, the band switch diode D7 will be turned on and the output from the VCO buffer amplifier will be fed to the two stage amplifier circuit.

The level is amplified to about 30 mW in Q14 and the final stage with Q13 boosts the level to about 200 mW measured at connector J4.

The first stage is working as a class A amplifier with the base on Q14 biased through R80, D7, R79, and R86. The output stage is working as a class C amplifier with a small base bias through resistors R72 and R73.

5.3.9. X-Tal Oscillator

The oscillator is of a Colpitt type and the oscillator transistor Q1 is oscillating by means of a 14.850 MHz crystal X1.

The trimmer capacitor C77 is for fine adjustment of the oscillator frequency.

RF signal for the second mixer in the receiver is taken from the collector of transistor Q1, connector J1.

The oscillator signal is buffered and amplified in transistors Q2 and Q3 before it is fed to the reference divider.

5.3.10. Reference Divider

The fixed divide by four reference divider U2 divides the X-tal oscillator frequency down to 3.7125 MHz before it is fed to the microcomputer via connector J2 and the phase locked loop reference divider included in U3.

5.3.11. RX Filter Control Amplifier

This variable slope DC amplifier made by means of an operational amplifier U1 converts the VCO control voltage to an appropriate control voltage for the varicap. diode tuned filters in the receiver front-end.

The maximum output voltage is adjusted by means of potentiometer R95.

5.3.12. Preemphasis Network

Capacitor C18 in conjunction with R35 and R96 introduces the needed 6 dB/oct. response of the AF input signal. The input sensitivity is adjusted by means of R96.

5.3.13. AF Amplifier/Compressor

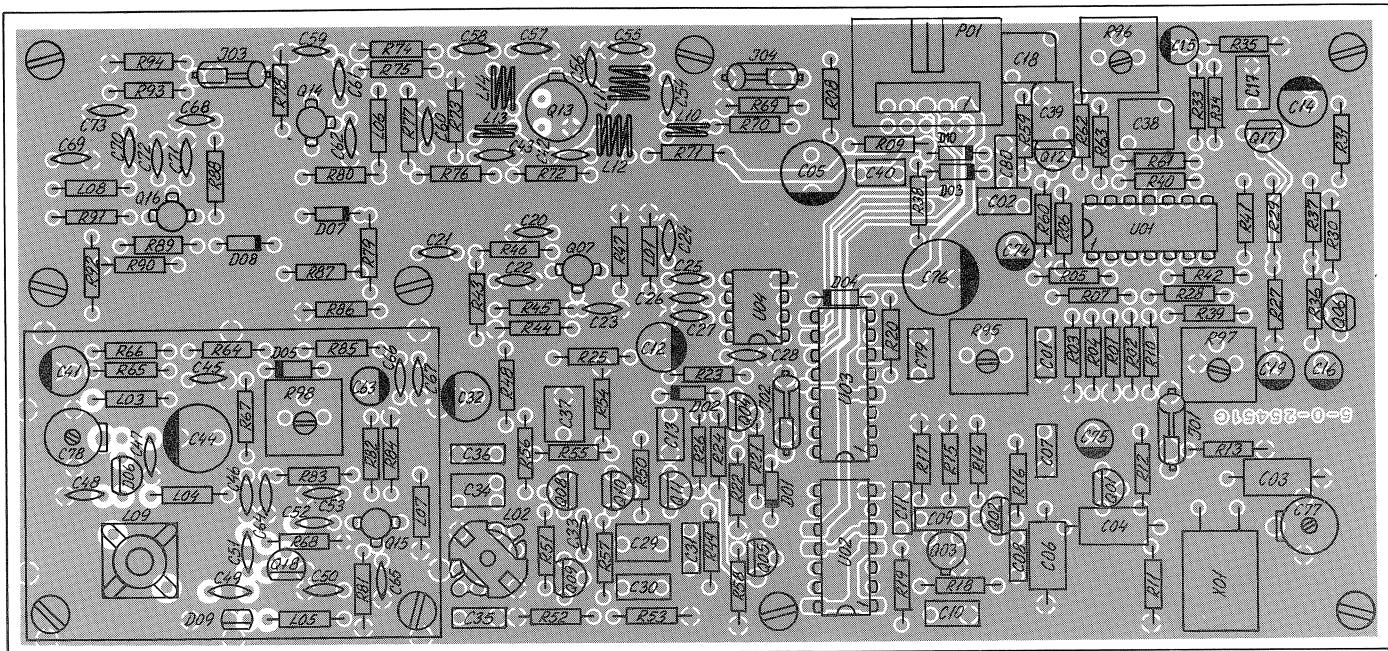

This circuit, formed around two operational amplifiers in U1, comprises both an amplifying and voltage limiting function. Amplifier No. 3 is a fixed voltage amplifier, the output of which is sensed by means of the comparator made by amplifier No. 2. When the peak output voltage exceeds a certain level, adjusted by means of potentiometer R97, the comparator will turn on transistor Q6, which in turn will charge capacitor C14. So the gate-source voltage on transistor Q17, acting as a variable resistor, will decrease and also the AC resistance between pin 10 on U1 and ground, which in turn will reduce the input level to the amplifier.

The rise-time of the compressor is mainly determined by resistors R38, R31, and capacitor C14. The decay-time by C14 and R30.

5.3. SYNTHESIZER UNIT cont.:

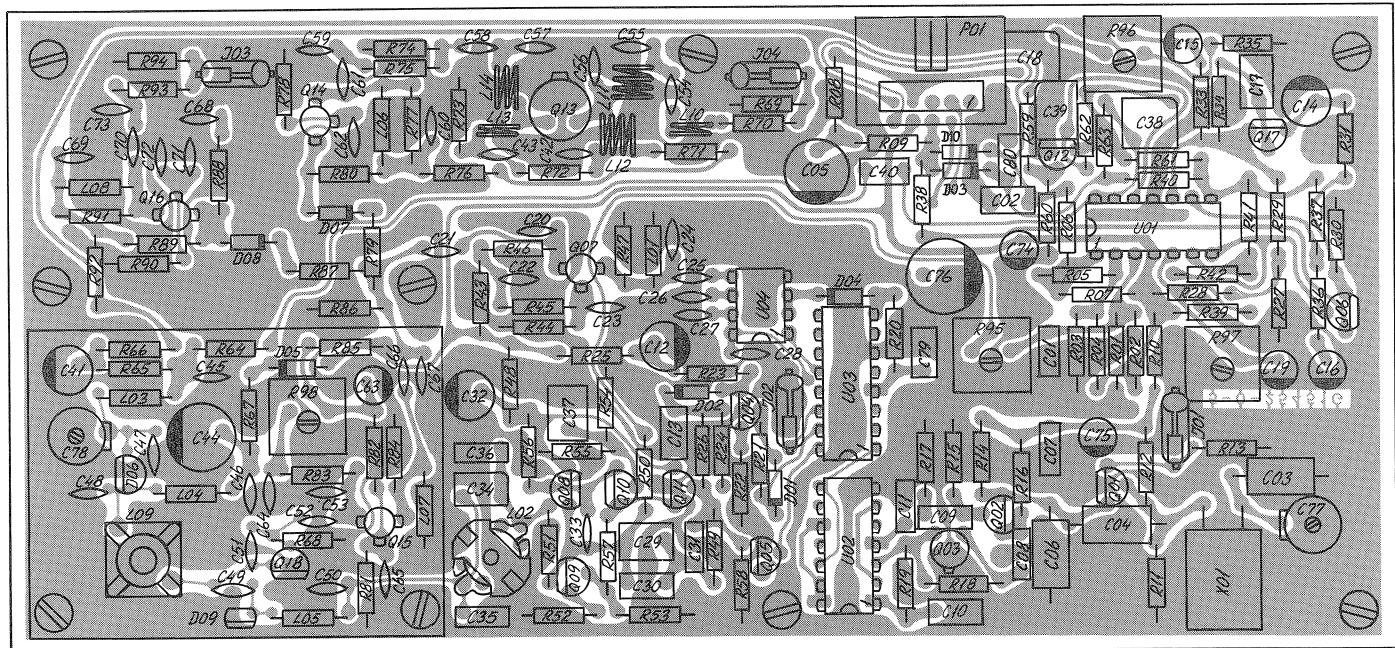

5.3.14. AF Post Filter

This second order active filter, built around operational amplifier No. 4 in U1, secures an appropriate high frequency roll-off of the AF signal. Resistors R64 and R65 give an appropriate attenuation of the AF signal before it is fed to the modulating diode D6 in the VCO.

Synthesizer Unit (3)

▲ APPROX. MEASUREMENTS WITH TEST PROBE
 ◉ APPROX. MEASUREMENTS WITH VOLTMETER

5.4. RX/TX UNIT (MODULE 4)

The RX/TX unit comprises the following circuits:

The receiver including detector
AF power amplifier
RF power amplifier
Harmonic filter
RF power control
8V power supply

5.4.1. RECEIVER FRONT-END

The RF amplifier covers the frequency range 154.400 MHz to 163.600 MHz and consists of the low noise Dual Gate Si-Mos-FET Q11 surrounded by two high Q double-tuned bandpass filters.

From the aerial the signal is led through the aerial relay to the receiver input bandpass filter. The input bandpass filter as well as the intermediate bandpass filter are controlled by a DC voltage on the tuning diodes. This DC voltage derives from the RX VCO control voltage and secures an optimum filter response in the whole frequency range of the receiver.

The two bandpass filters create the necessary attenuation of unwanted signals.

RT2048 A

5.4.2. FIRST MIXER

The balanced mixer has good large signal properties, securing good intermodulation characteristic.

The mixer transistors Q08 and Q09 are of the J-FET type.

The signal is led to the balanced input transformer TR2 and then to the gates of the J-FETs, which are switched by injecting the first LO signal into the sources. The mixed signals are fed to the balanced output transformer TR1 where the wanted signal on 15.3 MHz is selected by the tune circuit consisting of TR1 and C75.

R06 and R01 create the necessary impedance matching the IF crystal filter.

5.4.3. CRYSTAL FILTER

The receiver adjacent channel selectivity is maintained by means of the crystal filter FL2 in co-operation with the ceramic filter FL1. R57 and R39 give the impedance matching the crystal filter output.

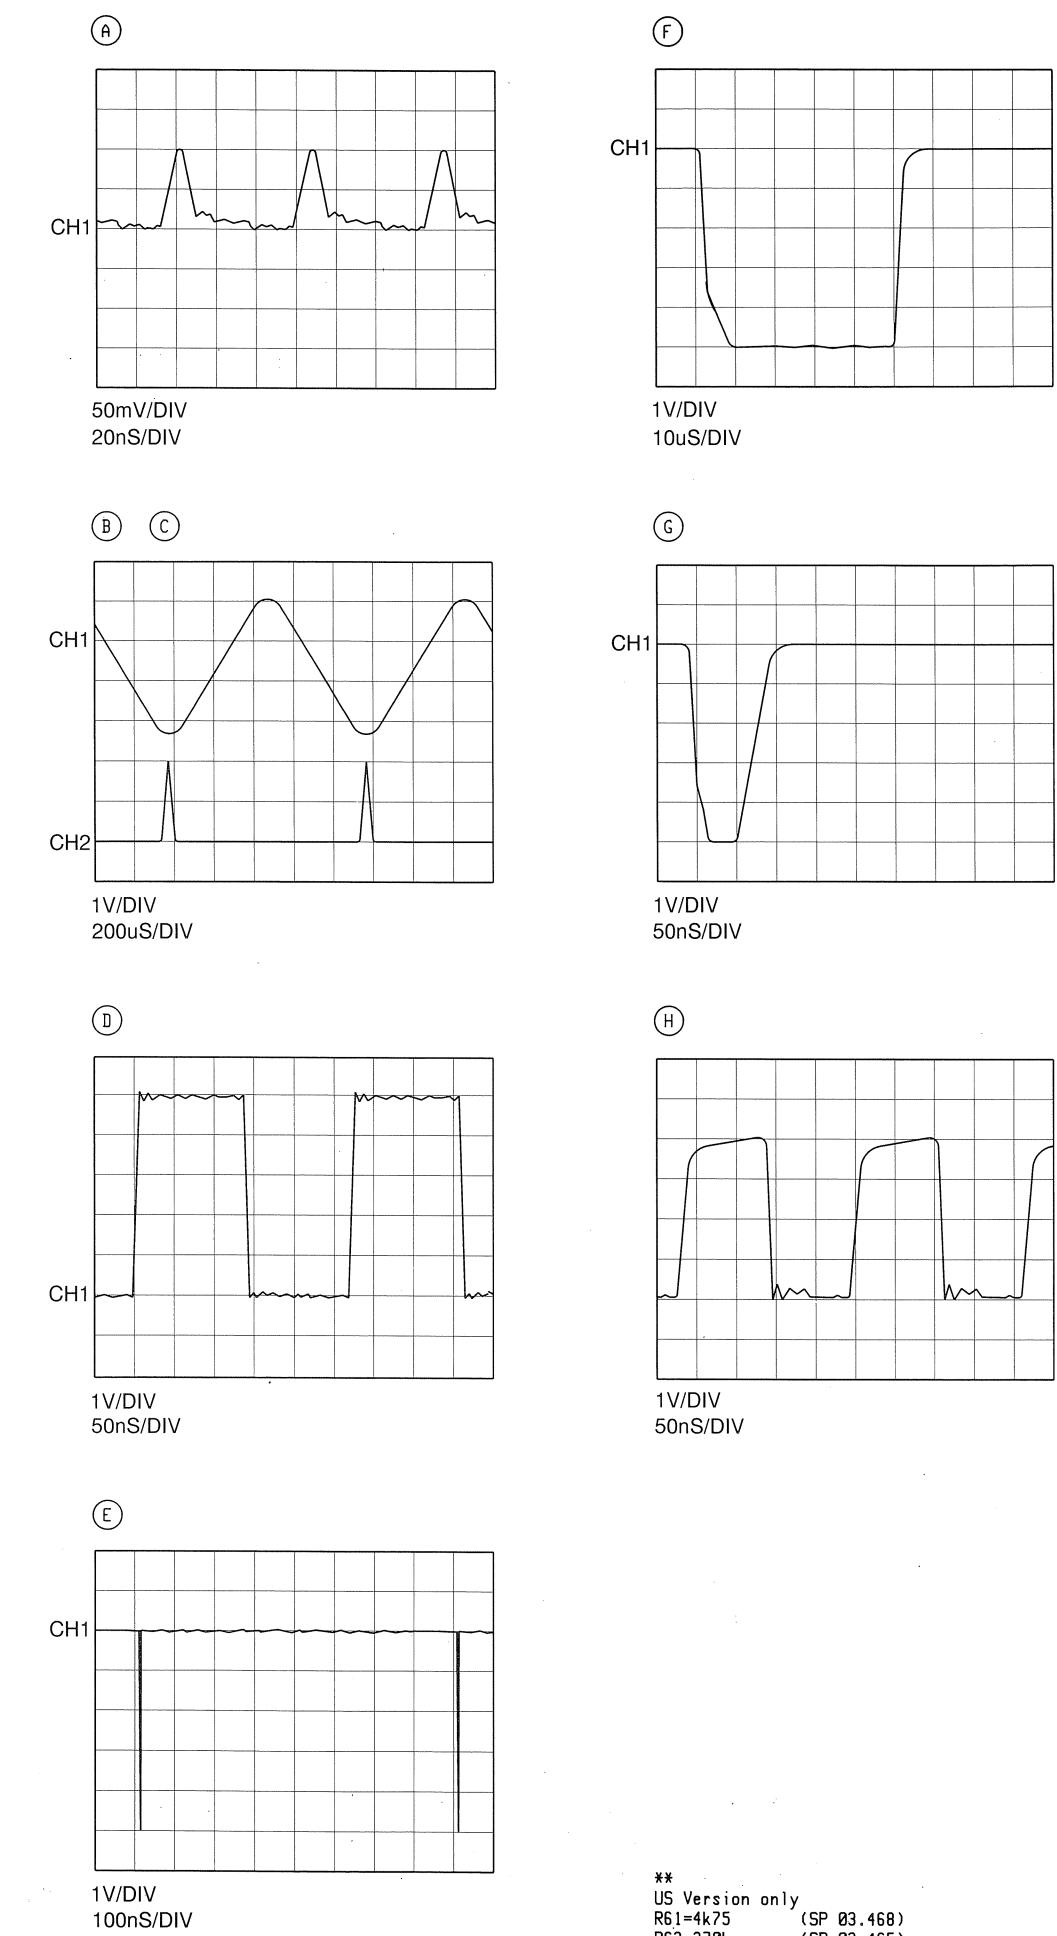

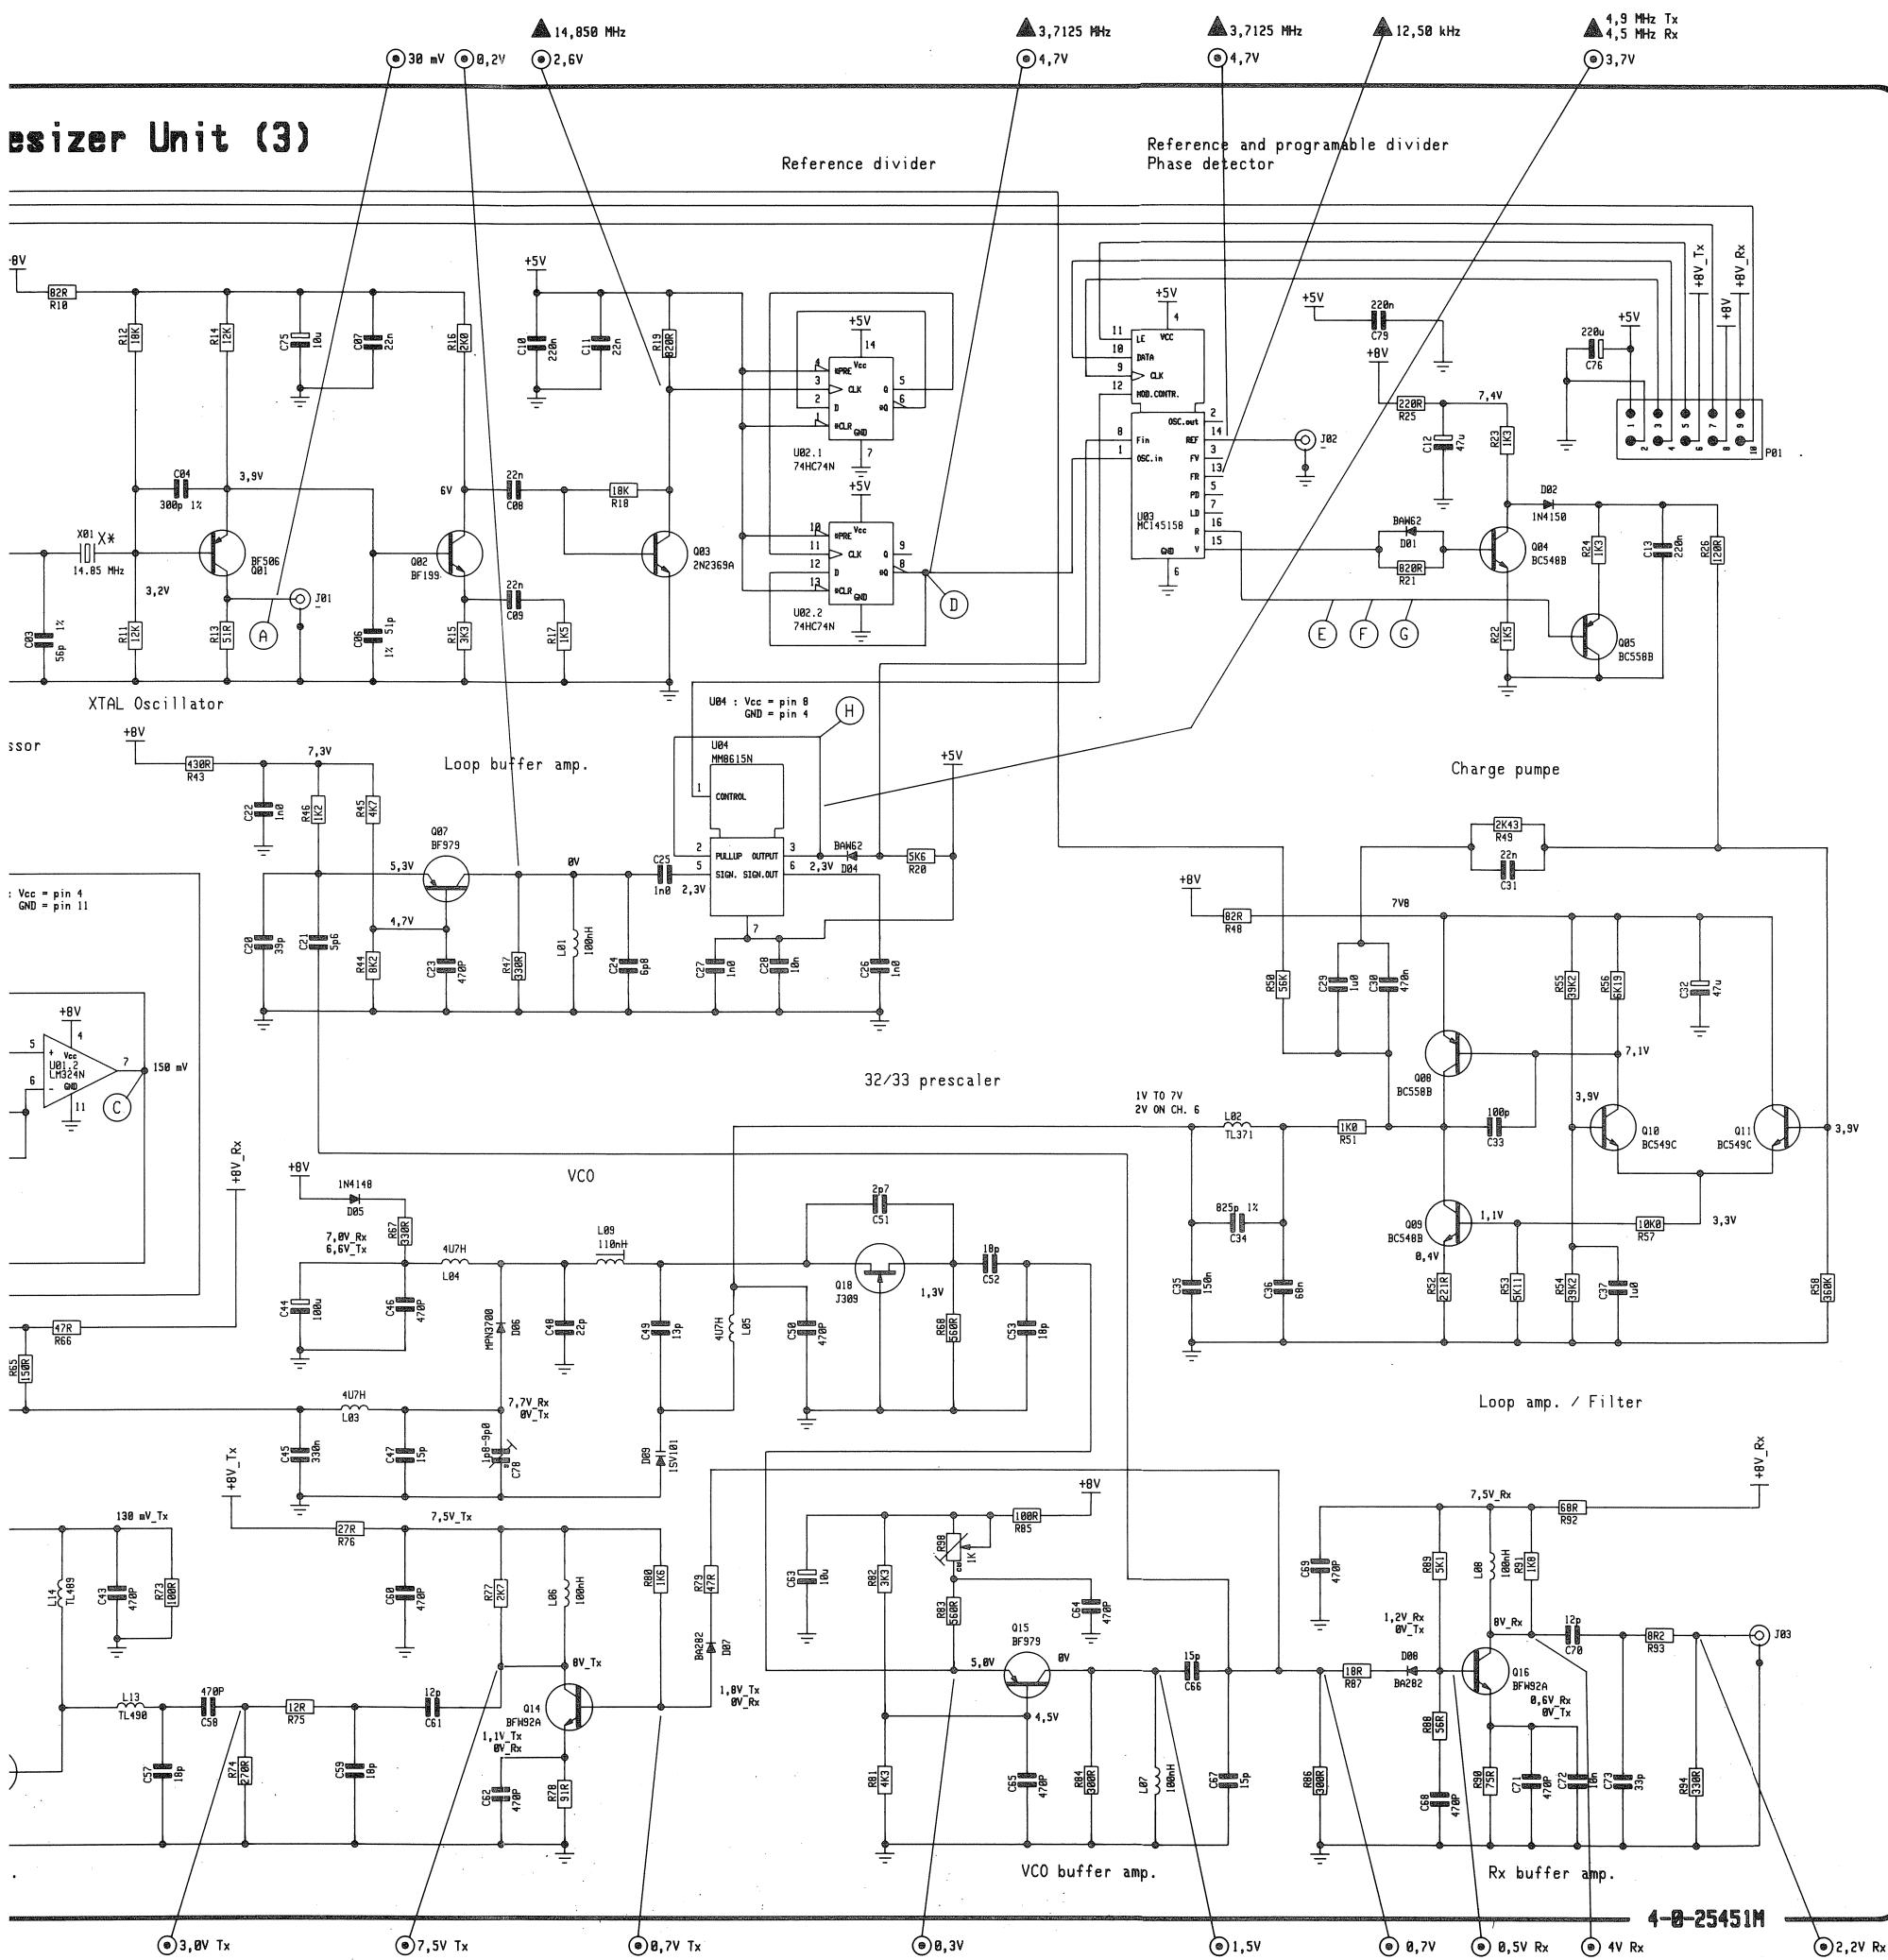

5.4.4. IF AMPLIFIER

The transistor Q10 amplifies the signal to the 2nd mixer, which has a tuned drain circuit consisting of L04 and C32. R34 creates the impedance matching the 2nd mixer.

5.4.5. SECOND MIXER, CERAMIC FILTER, DETECTOR AND AF AMPLIFIER

The second LO signal 14.850 MHz is amplified in Q02 before it is delivered to the mixer.

From the aerial the signal is led through the aerial relay to the receiver input bandpass filter. The input bandpass filter as well as the intermediate bandpass filter are controlled by a DC voltage on the tuning diodes. This DC voltage derives from the RX VCO control voltage and secures an optimum filter response in the whole frequency range of the receiver.
The two bandpass filters create the necessary attenuation of unwanted signals.

5.4.2. FIRST MIXER

The balanced mixer has good large signal properties, securing good intermodulation characteristic.

The mixer transistors Q08 and Q09 are of the J-FET type.
The signal is led to the balanced input transformer TR2 and then to the gates of the J-FETs, which are switched by injecting the first LO signal into the sources. The mixed signals are fed to the balanced output transformer TR1 where the wanted signal on 15.3 MHz is selected by the tune circuit consisting of TR1 and C75.
R06 and R01 create the necessary impedance matching the IF crystal filter.

5.4.3. CRYSTAL FILTER

The receiver adjacent channel selectivity is maintained by means of the crystal filter FL2 in co-operation with the ceramic filter FL1.
R57 and R39 give the impedance matching the crystal filter output.

5.4.4. IF AMPLIFIER

The transistor Q10 amplifies the signal to the 2nd mixer, which has a tuned drain circuit consisting of L04 and C32.
R34 creates the impedance matching the 2nd mixer.

5.4.5. SECOND MIXER, CERAMIC FILTER, DETECTOR AND AF AMPLIFIER

The second LO signal 14.850 MHz is amplified in Q02 before it is delivered to the mixer.

5.4. RX/TX UNIT cont.:

The signal out of the mixer (450 kHz) is fed through the ceramic filter to the limiter amplifier and discriminator in U03. The phase shift network to the quadrangular discriminator consisting of R11, L06, C33, and a 10 pF capacitor inside the IC. AF output is led through a lowpass filter consisting of R36 and C74, which removes the high frequencies (450 kHz). An internal operational amplifier amplifies the AF signal to 250 mV, which is adjusted by R20.

5.4.6. AF POWER AMPLIFIER

The AF power amplifier is capable of delivering 6 Watt in the internal loudspeaker (4 ohm) and 6 Watt in an external loudspeaker 4 ohm. The gain of 34 dB is fixed by the resistors R07, R08 and R09. The AF power amplifier is muted (pin 11, 0 = off, 1 = on) about 1.25 sec. after the squelch is closed.

5.4.7. RF POWER AMPLIFIER

The power amplifier covering the frequency range 154.4 MHz to 163.6 MHz consists of a module with 50 ohm terminations and 2 amplifiers. The first amplifier is the driver which has a gain of up to 12 dB, depending on the driver voltage from Q01. The input is about 200 mW. The second amplifier has a gain of 10 dB.

5.4.8. HARMONIC FILTER

The harmonic filter is realized as a seventh order Chebyscher filter, which at the same time will provide the necessary attenuation of the harmonic generated by the power amplifier and a low insertion loss at the carrier frequency.

The output is fed to the antenna relay.

5.4.9. RF POWER CONTROL

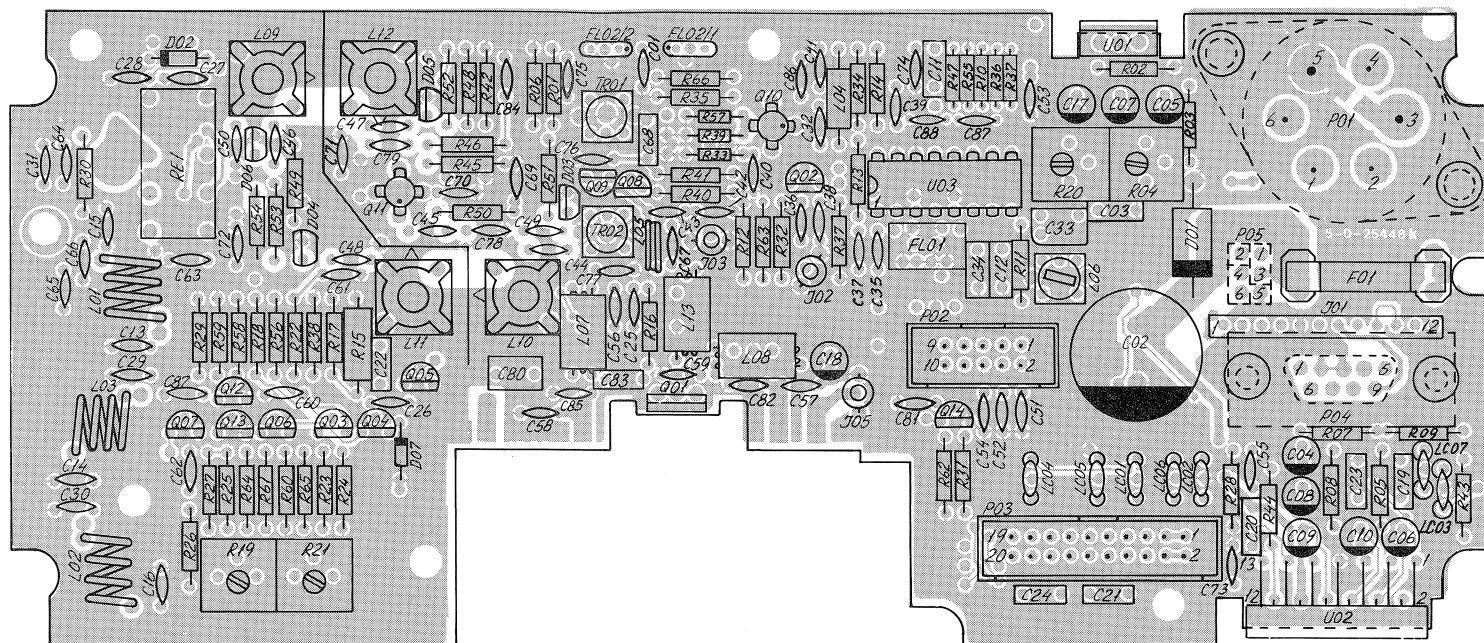

The power adjustment loop consists of Q04, Q03, Q05 and Q01. Q04 is the power detector which together with Q03 forms a differential circuit. The differential circuit controls Q05 and Q01 which are made as a Darlington transistor. C22, R17, and R15 make a feed-back in order to slow down the loop. Q12 controls the on/off function through the differential resistor R18. Q06 is the power indicator transistor which gives the microcomputer information about power on the output from the RF power amplifier. This information is active about 0.3 Watt. Q13 controls the 1 Watt/25 Watt change-over transistor Q07. If the power is lower than about 15 Watt in the 25 Watt position the power indicator transistor Q06 will make a smooth change-over to 1 Watt position through resistor R61. The 25 Watt adjustment is done on R21 and the 1 Watt adjustment is done on R19. The 25 Watt has to be adjusted first because it has influence on the adjustment of 1 Watt.

5.4. RX/TX UNIT cont.:

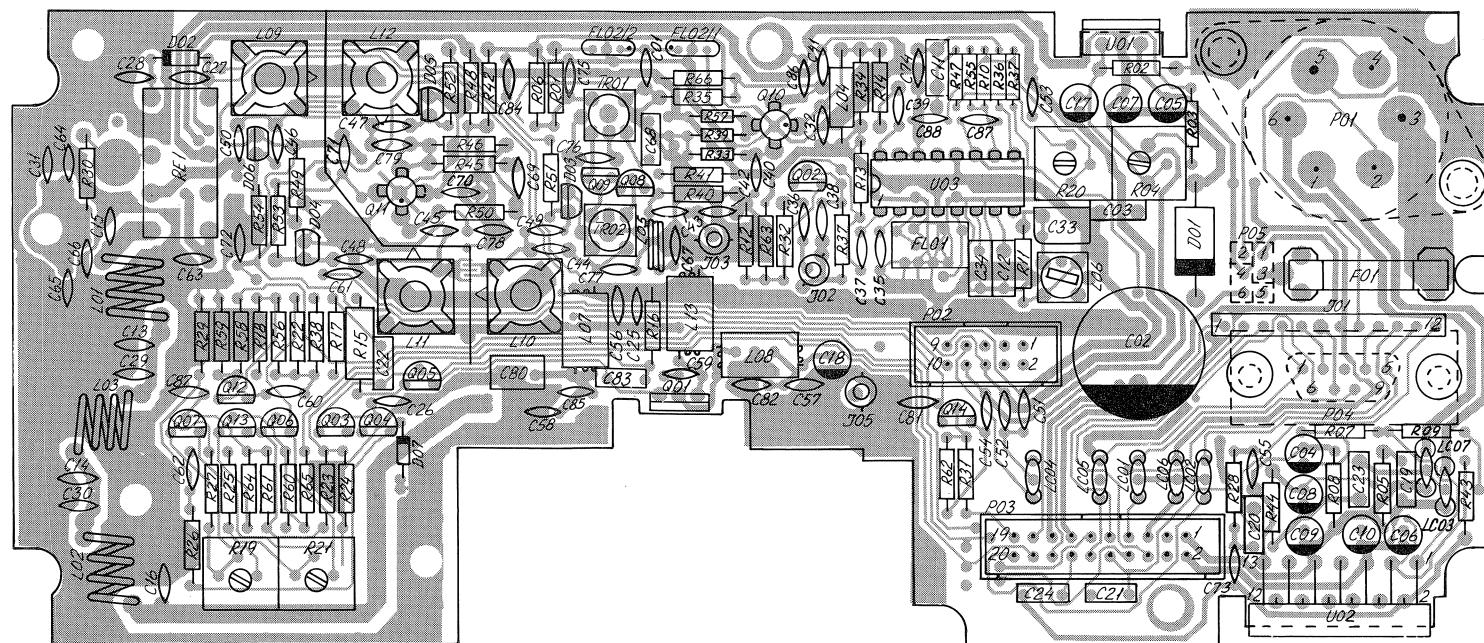

5.4.10. 8V POWER SUPPLY

The regulator U01 is supplied from the internal 13V supply.
The adjustment of the voltage is done on resistor R04.

The 8V supply is divided into 2 more supplies in the antenna relay, the 8V TX supply and the 8V RX supply.

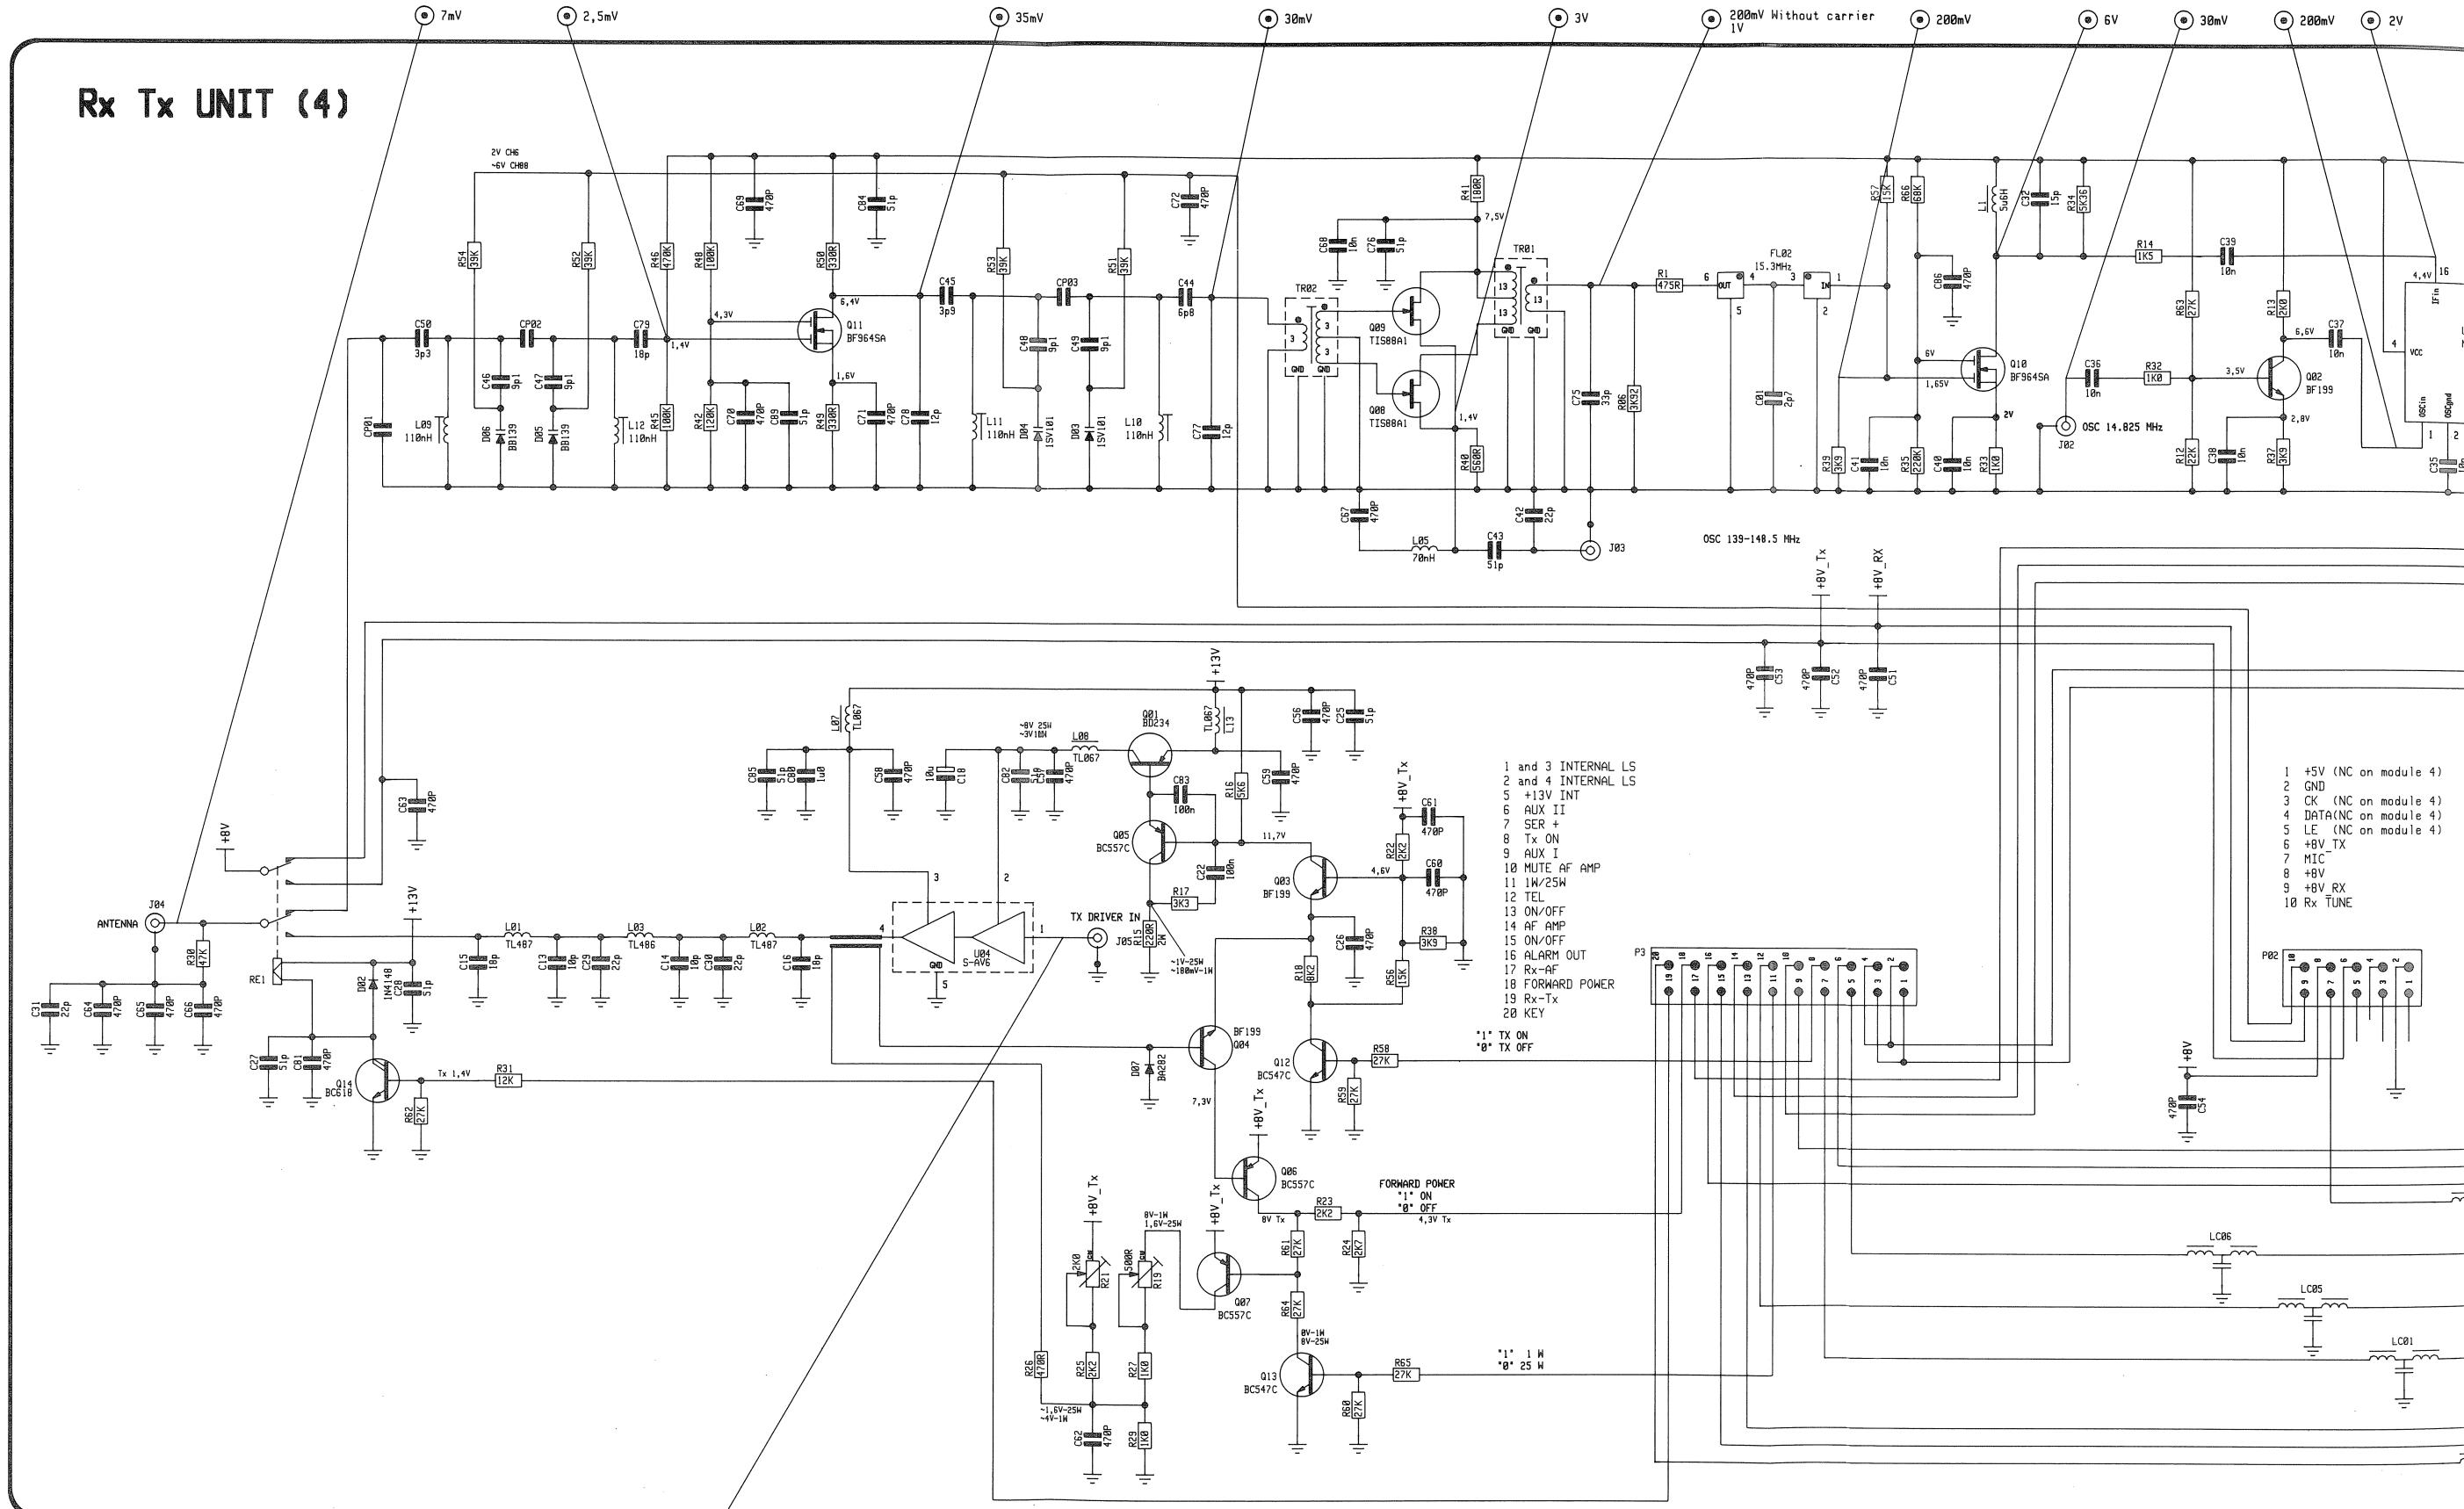

View from component side with upper side tracks.

View from component side with lower side tracks.

APPROX. MEASUREMENT WITH TEST PROBE
MEASUREMENTS ARE DONE WITH -30dBm RF INPUT.

Rx Tx UNIT (4)

5.5. SELCALL UNIT (MODULE 5)

The input to the selcall is taken from the telephone output. The signal is first amplified and limited in U04/2 and then it passes the bandpass filter. Finally the signal is rectified and compared with a reference level in the comparator U04/1.

3.7125 MHz is divided in the programmable counter U06. The output of this is divided by 2 and turned into a square wave in the flip-flop U03/2. The outputs of the flip-flop is connected to the switches U02. The frequency, at which the switches around the capacitors C03 and C04 are working, determines the resonance frequency of the filter. Thus by changing the dividing figure to U06, it is possible to change the resonance frequency of the filter.

With R01 it is possible to fine adjust the resonance frequency of the filter (see the adjustment procedure).

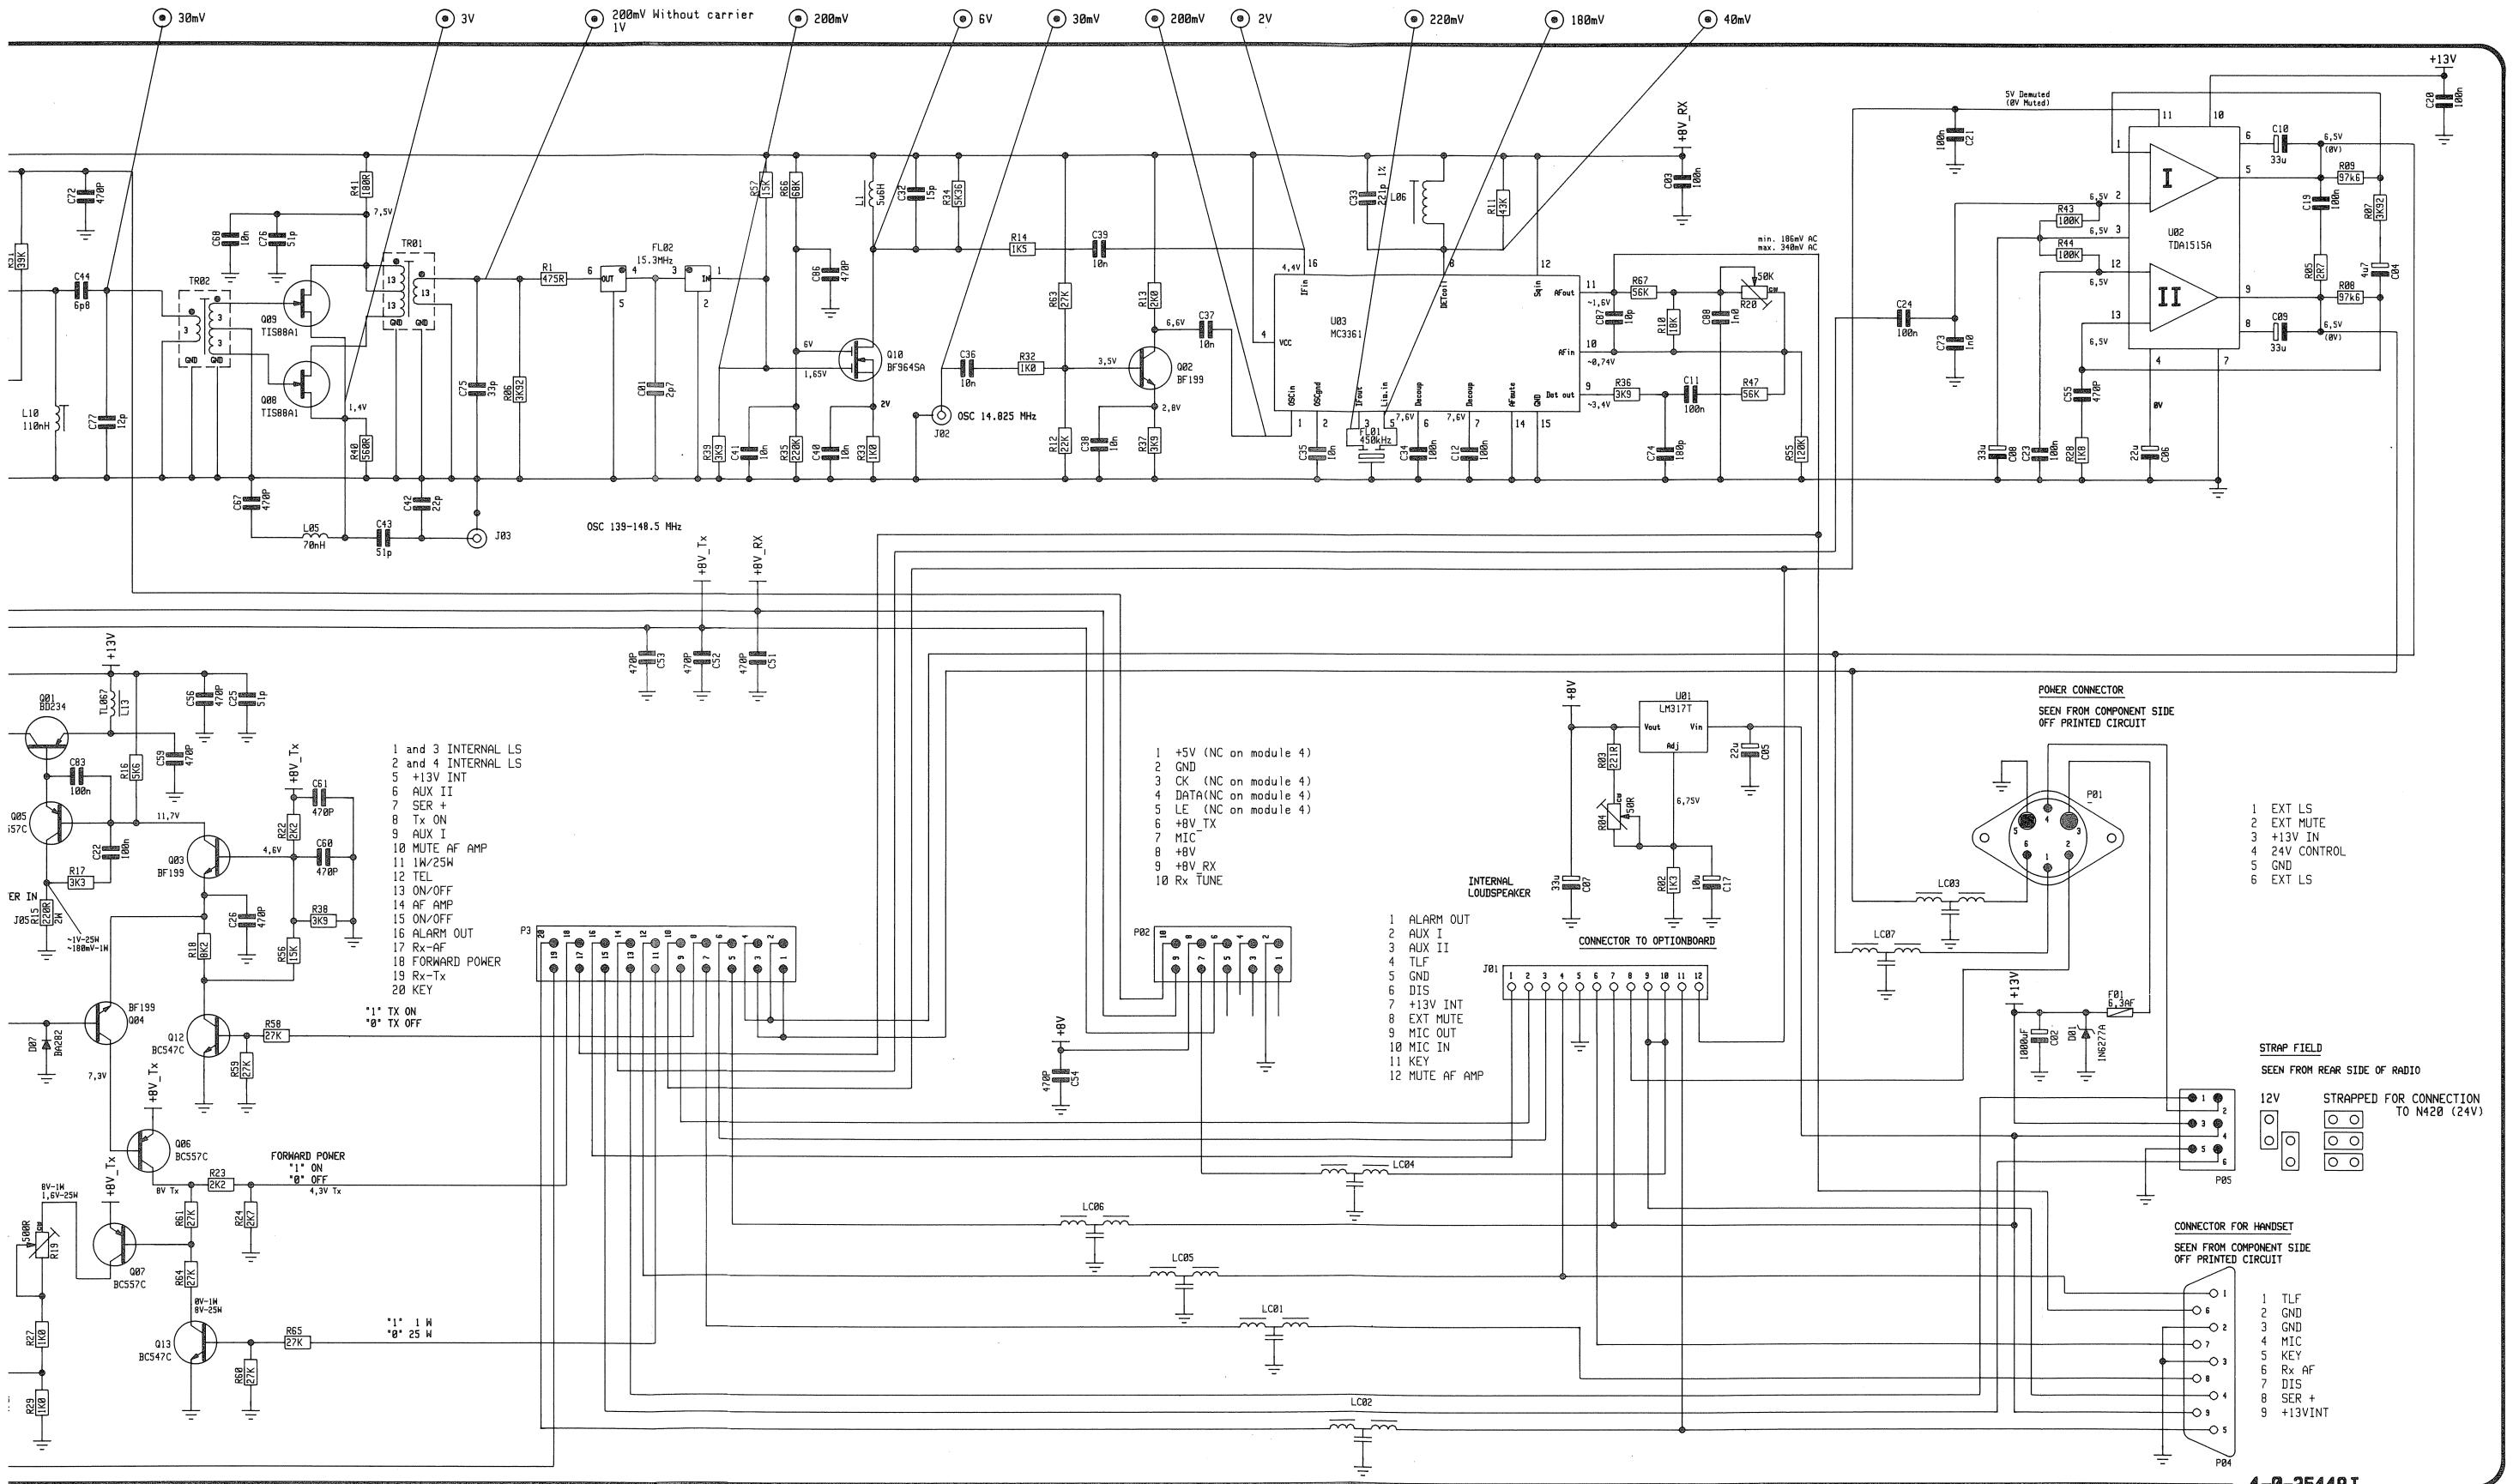

Figure No.	f(nominal) (Hz)	U06 input							U03 output (Hz)
		14	13	12	11	6	5	4	
1	1124	0	1	1	0	0	1	1	1
2	1197	0	1	1	0	0	0	0	18022

R	2110	0	0	1	1	0	1	1	32004
									33750

When the radio is switched on the dividing figure, corresponding to the first figure in the selcall number, is shifted out on port B0 on the uC at the interface unit which is connected to the input of U07.

U07 is a serial to parallel shift register which converts the signal to the dividing figure U06. If the correct tone is received the output of the comparator U4/1 goes low. This output is connected to the uC's SEL-DET. pin. When the tone disappears again the uC will put out the dividing figure corresponding to the next figure in the selcall number.

If all five tones are received correctly, the port C06 (EXT. ALARM) on the uC goes high. This port is connected to pin 1 on the connector to the option board at the RX/TX unit. At the same time the uC will send out an alarm tone from D06 via the volume control and power amplifier to the loudspeaker. The alarm tone lasts for 10 secs after an individual call, and after an all call it lasts until the selcall has been reset.

If the SELCALL T/R button is activated the alarm circuits and indicators are tested.
