STORNOPHONE 4000 AUTOMATIC

Local controlled personal radio for simplex operation with all necessary indicators located in a liquid crystal display.

The construction of the electronic keyboard is using the most modern laminated film technology.

The operation of the CQP4000 automatic is fully controlled by microprocessor.

Remote

STORNOPHONE 4000 AUTOMATIC allows remote control.

GENERAL DESCRIPTION

CQP4000 AUTOMATIC

The CQP4000 Automatic is a personal radiotelephone with transmitter, receiver, controls and display, loudspeaker, microphone and battery. Although being handheld and compact in size the radio can be programmed with up to 99 channels and equipped with tone facility.

The mechanical construction of the radio is a screened enclosure in the form of a cast chassis and a metallized plastic front as lid. A moulded plastic house is attached to the chassis to provide mechanical protection and hold the battery. All controls and indicators are integrated in a keypad/display field on the radio front except for the transmit button which is on the left side of the radio. The electrical circuitry of the radio is built on printed wiring boards: an RF-board containing the transmitter and receiver, a control logic board and a thick film tone module.

The RF-board comprises the frequency synthesizer, the transmitter exciter and power amplifier, the receiver RF circuits and IF-circuits, the voltage regulator, and is available in different versions according to frequency band and channel spacing.

The control logic board (CL) comprises the receiver AF amplifier, the transmitter modulation processor, the microcontroller sub-module PU4001 and the display.

The tone module is a thick-film add-on module designed to be plugged into a socket on the CL-board.

ANTENNAS

The CQP4000 is designed for a 50-ohm antenna which is screwed onto the top of the radio. The following types are available:

- a resonant helical antenna, AN4xx1
- a wide band conductive rubber antenna, AN4xx2

BATTERIES

The battery is designed to snap into a compartment at the bottom of the radio and is a self-contained nickel-cadmium (Ni-Cd) pack.

Two battery packs are available:

- a 450 mA battery, BU4001
- a 750 mA battery, BU4002

The CQP4000 Automatic version is furthermore fitted with a lithium battery which serves as back-up for the microcontroller's data memory. Estimated minimum lifetime of this battery is 3 years.

CARRYING DEVICES

The following devices are available for carrying the radio:

- a carrying strap in leather with eyelets, CK4003
- two carrying cases in stout leather, CK4004 and CK4005, one for each battery version of the CQP4000
- a belt retainer, CK4006, comprising a bracket to mount on a special plast cabinet CA4002 + a leather ring with a swivel lock.
- a belt clip, CK4007, which must also be mounted together with CA4002
- a leather carrying case, CK4008, with cut-aways for multiconnector
- a leather carrying case, CK4009, with cut-aways for multiconnector intended for BU4002 application

REMOTE CONTROLS

Three different remote control boxes are available. They are used in conjunction with a special cabinet, CA4003, and a special chassis, CH4003. The control boxes differ from one another only on the basis of a "special functions button".

- CB4001 has no extra push button
- CB4002 has one extra push button either for control of tone keying or LS ON/OFF
- CB4003 has two extra push buttons, one for the tone key and one for LS ON/OFF.

BATTERY TESTER

A battery tester is available for checking the chargeing condition of batteries. A button on the tester loads the battery and the charge condition is read on a meter scale, SI4001.

MECHANICAL DESCRIPTION

CQP4000 AUTOMATIC

CHASSIS BOX

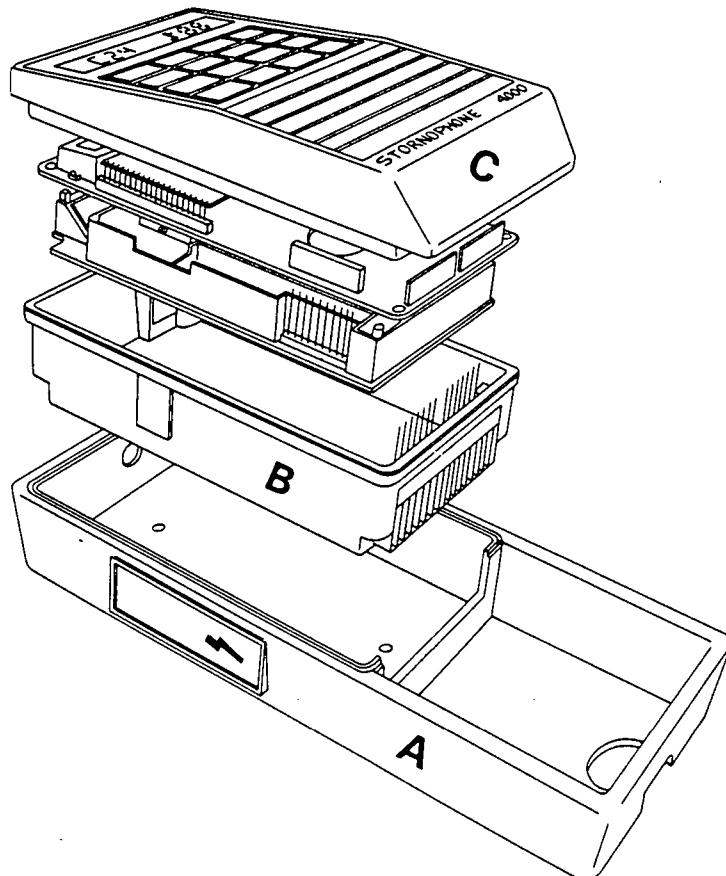

The chassis box is a tin plated zinc casting provided with an antenna socket and a sealing gasket for transmit button which activates a microswitch on the control logic board. The combined battery/test connector is attached to the chassis and potted for weather protection. Inside the bottom is a plate with fingers pressing against the solder side of the RF-board and thus obtains the necessary ground connections.

The RF and CL boards are kept in position with 4 screws which attach the chassis box

to the front part. In the chassis bottom are two threaded inserts for attaching the rear part of the plastic cover.

The plastic cover has a battery compartment which will accept two types of batteries. The battery snaps into position by means of a moulded contour on the inner side of the compartment wall. The battery is released by pressing through a hole in the rear wall.

An 18-position battery and test connector is placed inside the battery compartment. 5 of the connector pins are used for connection to the battery. The others are used for automatic or manual testing.

A: Plastic cover
B: Chassis box
C: Control Panel Front

CIRCUIT DESCRIPTION

CQP4xxx

RECEIVER

The receiver is a dual conversion superheterodyne receiver with a first IF of 21.4 MHz and second IF of 455 kHz. All receiver circuitry except the AF amplifier is placed on the RF board.

RECEIVER FRONT END

The receiver front-end consists of a 2-resonator input filter, an RF amplifier, a 2-resonator intermediate filter and a mixer.

IF AND DEMODULATOR

The mixer output is fed through a matching circuit to the crystal filter.

The crystal filter output is fed to the dual gate MOSFET which overcomes the noise figure of the following stages and provides constant load to the crystal filter.

The following integrated circuit includes crystal oscillator and active mixer, second IF amplifier, quadrature discriminator and schmitt trigger for squelch.

SQUELCH

The squelch circuit is a separate thick film module. The AF signal from the quadrature detector is fed to an active high-pass filter where noise above 7 kHz is extracted.

Via the squelch potentiometer, adjusted for 10-12 dB SINAD, the signal is fed to an amplifier to obtain the right level for the detector.

The detector output is connected to the schmitt-trigger, part of the preamplifier circuit, which gives the necessary hysteresis and well-defined output signal.

PREAMPLIFIER

The last stage of the IF integrated circuit is an AF preamplifier. Its output can be adjusted to 110 mV by a potentiometer.

AUDIO AMPLIFIER

The line level of the AF preamplifier is fed to the audio amplifier situated on the CL board (see the chapter about CL description).

TRANSMITTER

The transmitter consists of an exciter and a power amplifier.

The VCO (voltage controlled oscillator) drives the exciter directly. The exciter contains wide-band stages and delivers input to the power am-

plifier. All stages, including the VCO operate at carrier frequency.

The power amplifier includes the output stage, a low-pass filter and a power control circuit.

The power amplifier is connected to the low-pass filter via a diode antenna switch.

EXCITER

In the exciter, the VCO signal, 1 mV is amplified to 0.5 Watt.

The exciter consists of three wide band stages covering the whole band. The RF bandwidth is limited by the VCO.

The exciter needs no adjustment.

POWER AMPLIFIER

The power amplifier consists of a single broad-band stage.

The antenna is matched to the power amplifier by tuning the antenna or by using a wide band antenna.

A power control circuit protects the RF output from temperature or voltage variations and keeps it relatively constant.

The output power level can be set with a potentiometer over a 2:1 range.

TX AUDIO PROCESSOR

The modulation signal is delivered from the TX audio processor situated on the CL board (see chapter of CL description).

WARNING: The transmitter PA-transistors contain Beryllium. It is dangerous to cut, to file or to disintegrate those transistors because the beryllium oxide is poisonous when absorbed.

FREQUENCY SYNTHESIZER

The frequency synthesizer circuits are:

- Prescaler
- PLL unit
- Ref. crystal oscillator
- TX and RX VCO (voltage controlled oscillator)
- Save switch

PRESCALER

The prescaler is a high speed counter which divides by a fixed ratio: P

Under control of the PLL circuit, it can be set to divide by the fixed ratio plus one: P+1

The prescaler has a low power consumption from 4 to 7 mA.

1. The R divider divides the output of the crystal oscillator in order to give channel spacing. Its output is fed into the phase detector.
2. The N divider divides the output of the prescaler. The ratio stored in the N divider must be the one giving N output equal R output. Its output is fed into the phase detector.
3. The A divider is controlled by the control logic. The ratio of the A divider makes the prescaler divide by P+1 if necessary. The A divider can not start with a zero.
4. The phase detector compares the outputs of the R and the N divider.

The phase/lock detector two outputs are:

- out of lock/lock signal to the CL board, indication whether or not the two inputs (R and N outputs) are equal.
- DC level controlling the VCO through a band-pass filter and a save switch.

PLL AND ASSOCIATED CIRCUITS

The circuitry consist of:

- three programmable dividers
- control logic for the prescaler
- phase detector with lock detector

REFERENCE CRYSTAL OSCILLATOR

This crystal oscillator supplies clock signals to the microprocessor on the CL board and gives the reference frequency to the PLL circuit through the R divider.

TX AND RX VCO

The voltage controlled oscillator (VCO) is a FET oscillator. The frequency is controlled by two varicaps, one in the RX VCO circuit and one in the TX VCO circuit. The varicaps DC voltage is delivered from the PLL circuit.

The TX VCO contains another varicap used for frequency modulation. The modulation signal co-

mes from the microphone amplifier placed on the CL board.

As buffer between the VCO and the PLL circuits, the following circuits are used:

- the mixer injection buffer for the RX VCO
- the exciter for the TX VCO

SAVE SWITCH

In order to reduce power consumption in standby, the save circuits disconnects:

- DC control level to the VCO
- power to the prescaler

The save circuit is controlled by the microprocessor from the CL board.

It is not connected to TX VCO.

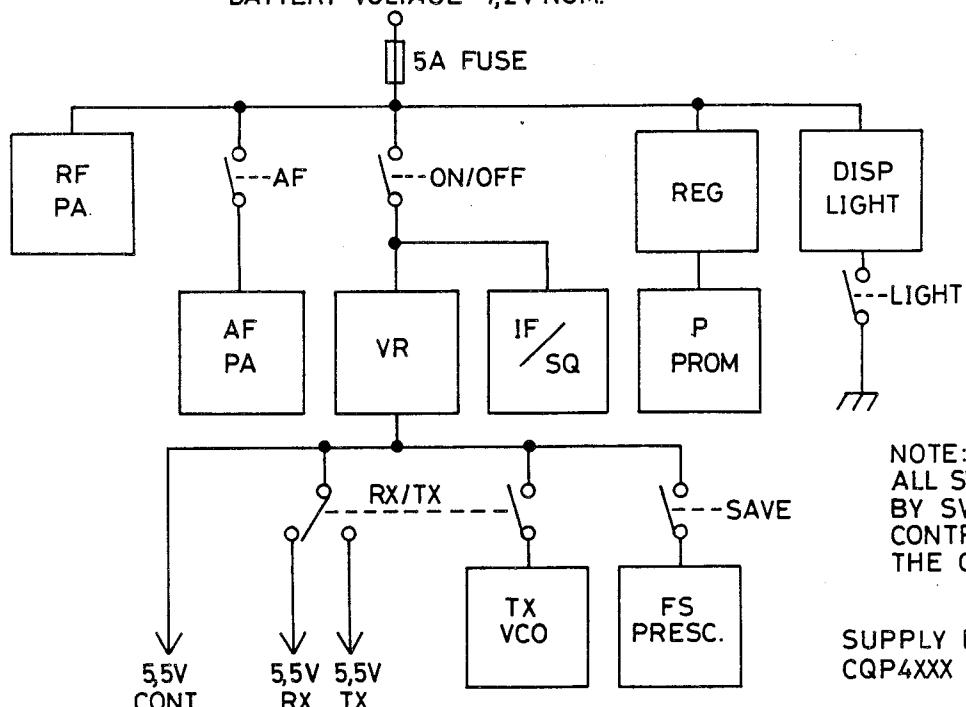

POWER SUPPLY

The 7.2 V battery voltage is distributed for different purposes through a 5 A fuse:

- directly to the RF power amplifier
- to the audio output amplifier through a switch transistor

- to the IF/squelch circuits and the 5.5 V voltage regulator through the on/off switch transistor
- to the personality PROM through a separate regulator
- to the LED's for the LCD display-back-light.

BATTERY VOLTAGE 7,2V NOM.

NOTE:
ALL SWITCHES ARE MADE
BY SWITCH-TRANSISTORS
CONTROLLED FROM
THE CONTROL LOGIC.

SUPPLY DISTRIBUTION SYSTEM

2%	25%	73%	NO	7.6 h	12.6 h	8.2 h	13.6 h

VOLTAGE REGULATOR

A 5.5 V stabilized voltage regulator is designed around an adjustable shunt regulator IC, with low drop-out voltage, high temperature stability and short circuit protection.

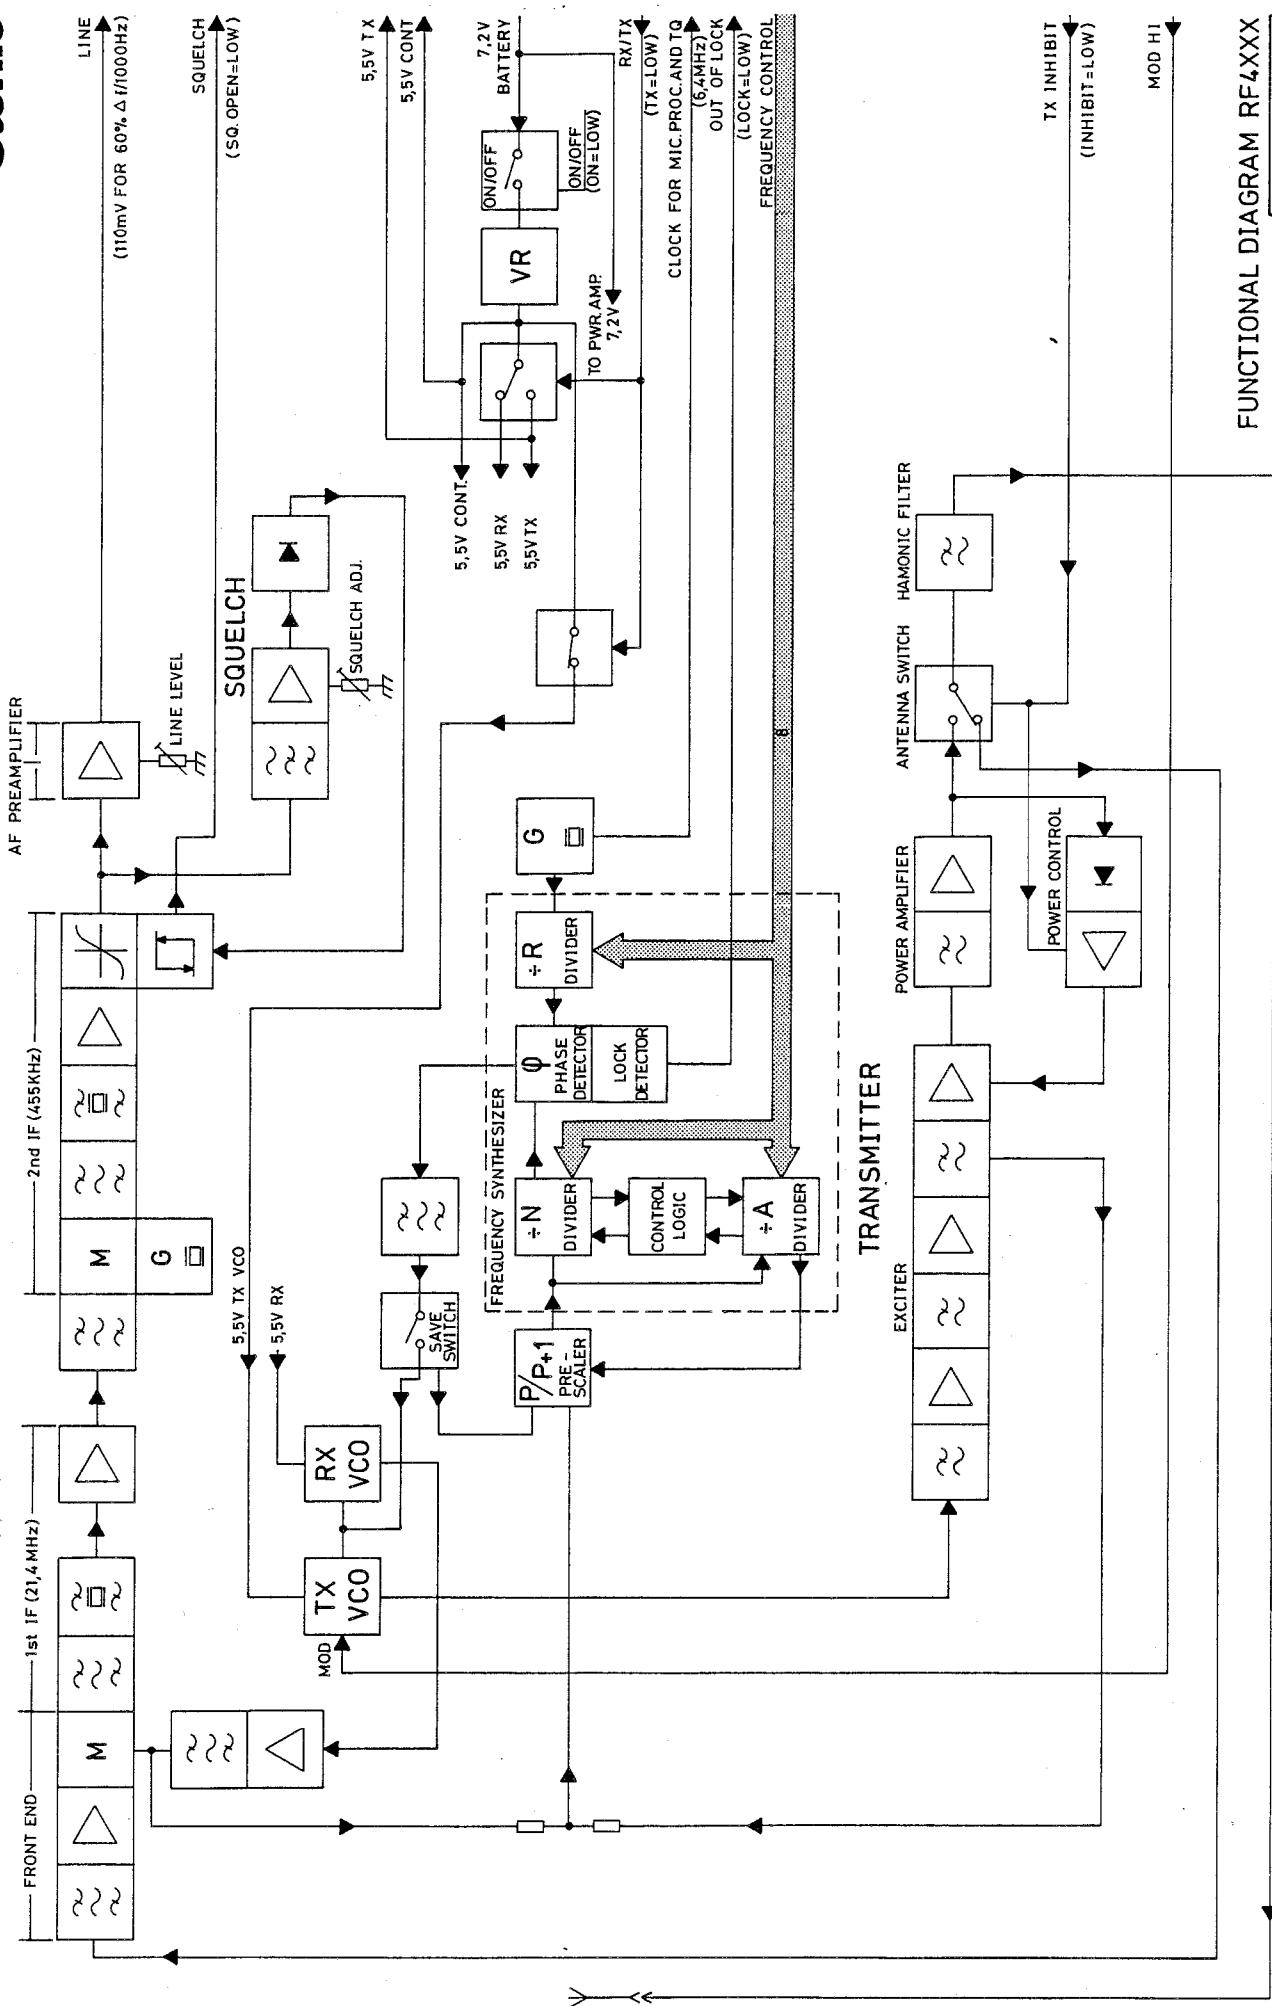

Regulated 5.5 V is continuously applied to the IF-squelch and synthesizer circuits, to the RX/

TX switch-circuit controlled by the control logic, and through a current save switch to the pre-scaler in the RF synthesizer.

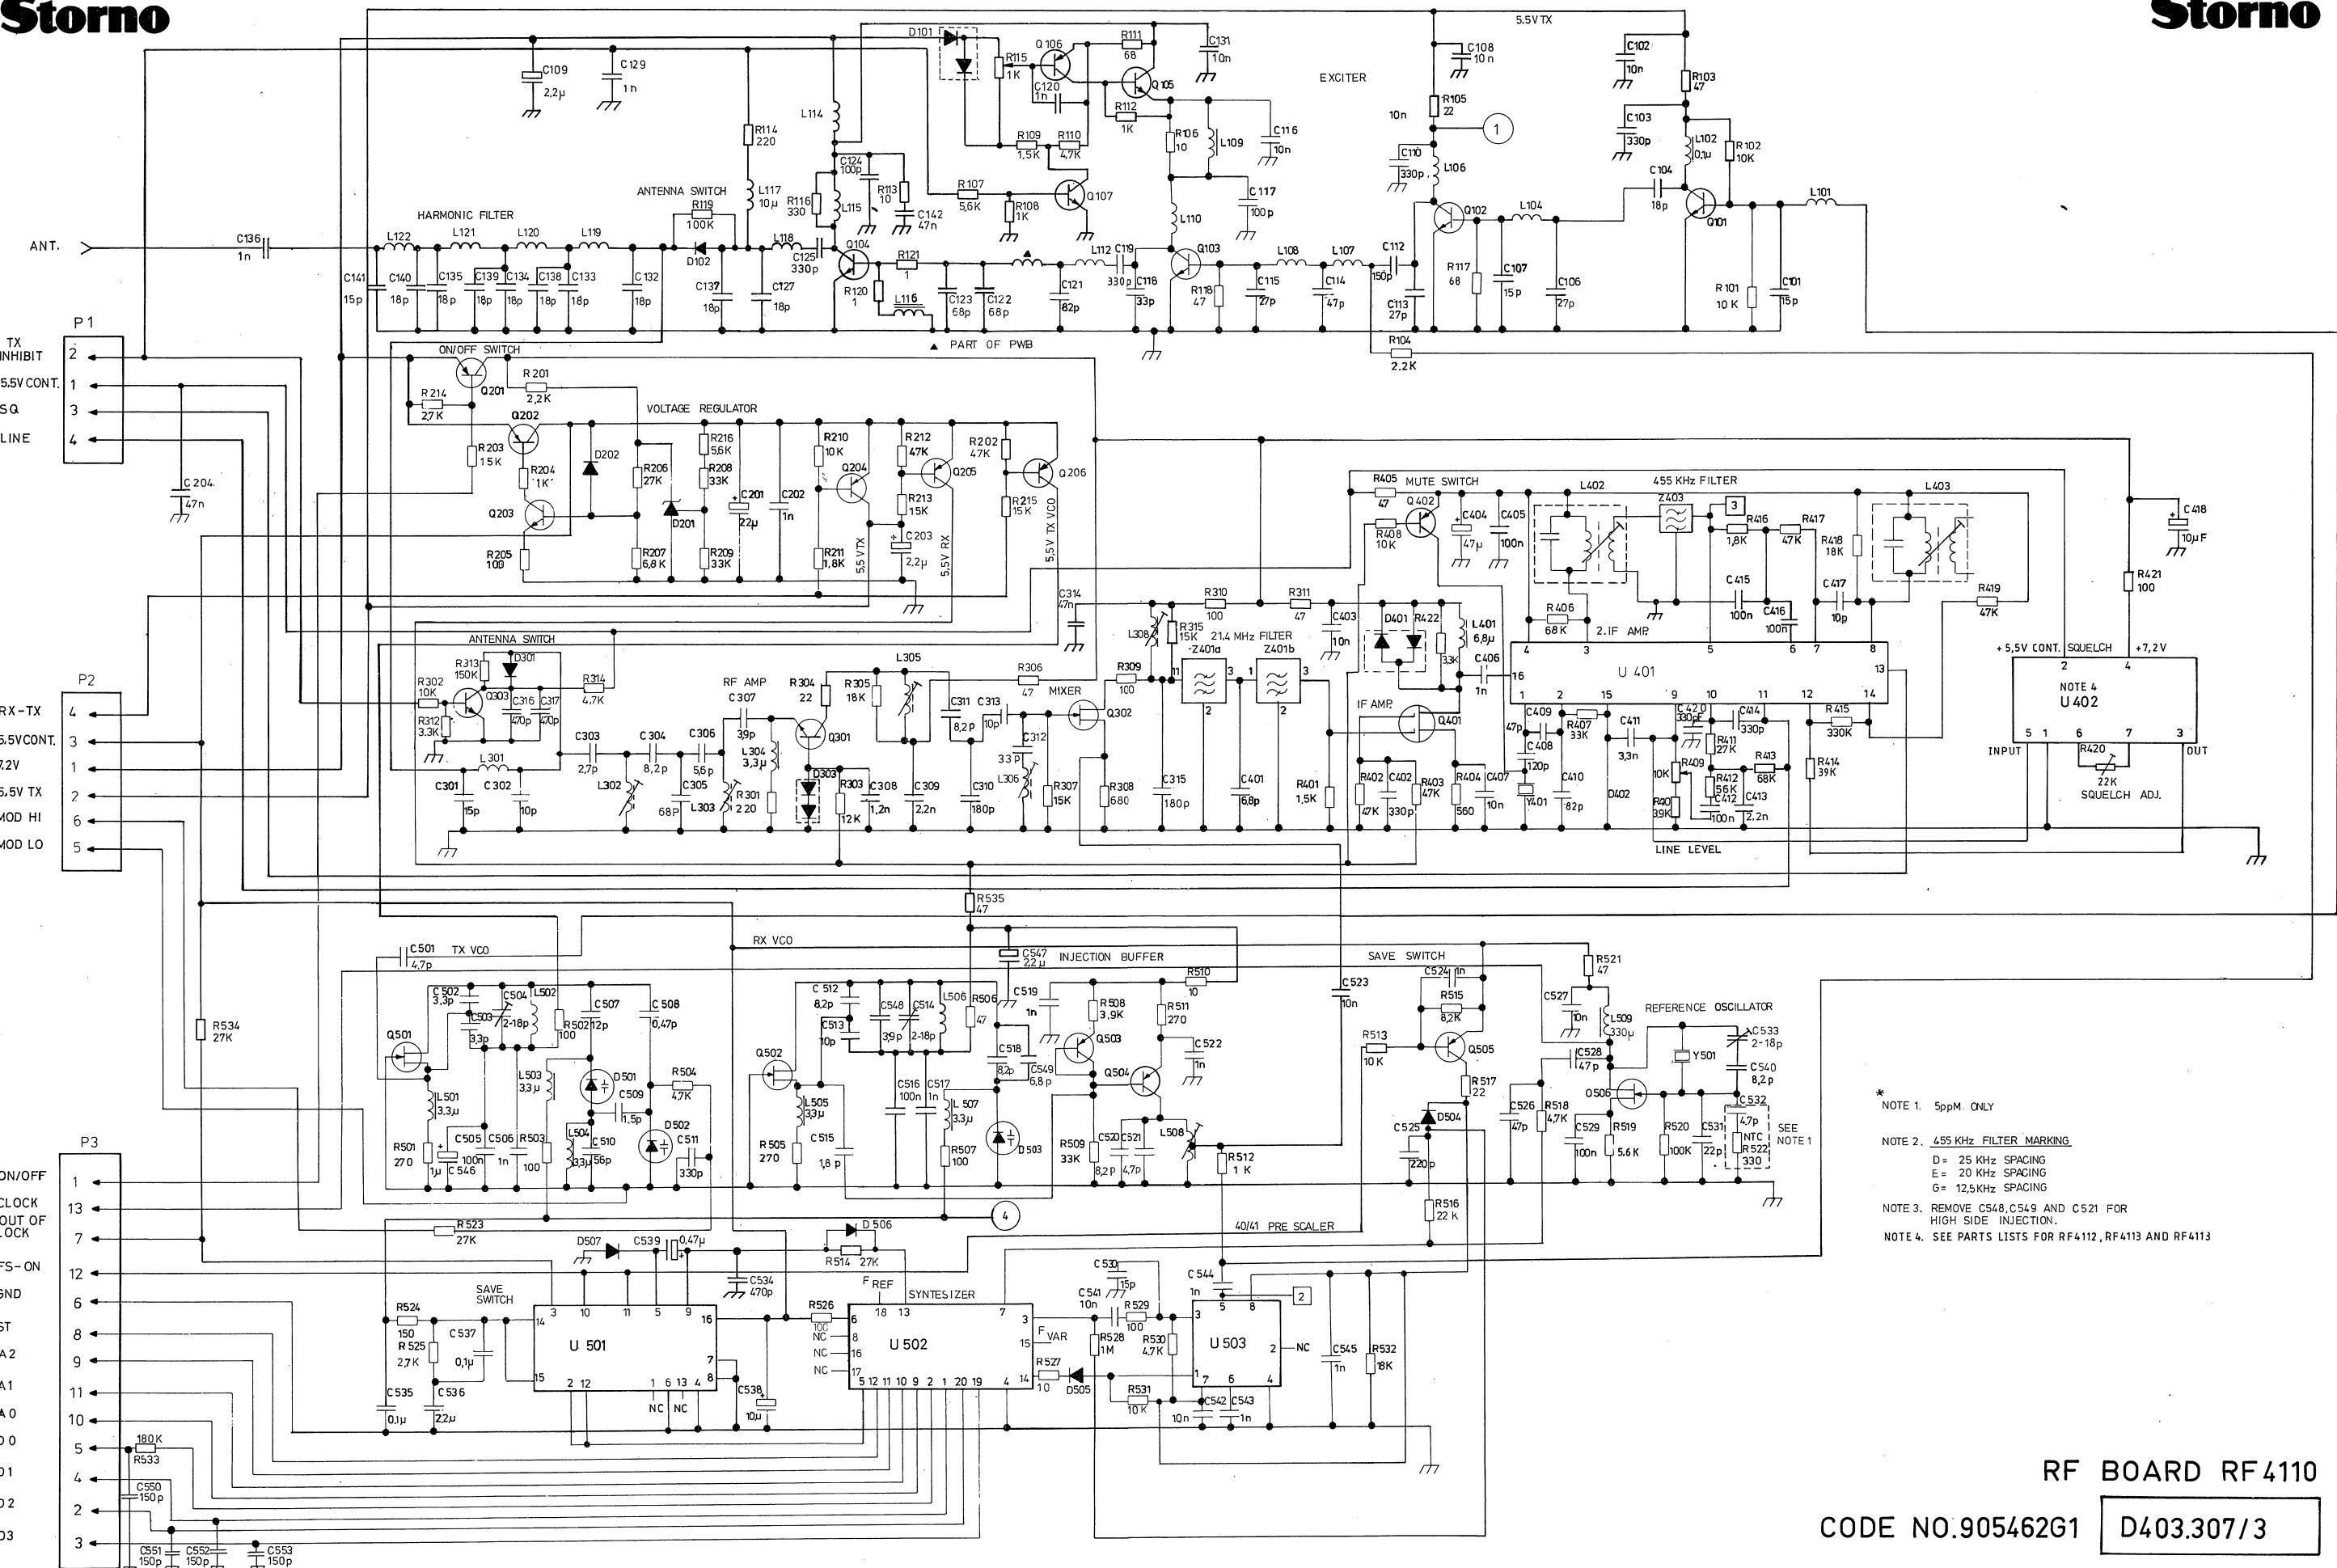

The RX/TX switching is performed, where possible, by switching only the bias currents to the involved circuits.

CL4003

CONTROL LOGIC BOARD

The control logic board assumes all the control functions of the radio:

- o Logic control circuitry
 - microcontroller submodule PU4001 with EPROM (including program memory and personality data)
 - frequency divider
 - display driver
 - input/output expansion system

- o Other functions
 - back-up battery
 - TX audio processor
 - audio output amplifier
 - microphone control
 - other functions
- o CL-board, Interconnections

LOGIC CONTROL CIRCUITRY

MICROCONTROLLER SUB-MODULE PU4001
(see separate description)

FREQUENCY DIVIDER U901

The crystal oscillator situated on the RF-board provides the 6.4 MHz (J903 pin 13) to the frequency divider clock input, pin 11 at U901. U901 acts as a buffer to the microcontroller clock and supplies:

- 1) system clock used in the tone option: 200 kHz (U901, pin 5) (J904, pin 7)
- 2) clock for power-up/down circuitry: 50 kHz (U901, pin 6)
- 3) Attention tone: 844 Hz (U901, pin 2) (U902b, c)

DISPLAY DRIVER U913

U913 is served by the output latch U911. The display driver is capable of driving an LCD display with 32 segments in static mode. Segments are loaded serially and a built-in one point oscillator provides the correct waveforms for segment and backplane AC drive voltage.

The LED's H902 to H905 illuminate the display.

INPUT/OUTPUT EXPANSION SYSTEM

One IC (U914) is used to buffer the output expansion system and to isolate the microcontroller in the power-down state, where it receives back-up supply.

One IC (U904) decodes three lines of port 1 into 8 possible addresses, while the lower half of port 1 acts as a 4-bit data bus. Six 4-bit latches (U905, U906, U908, U909, U910, U912) are connected to this bus and serves as output ports.

The three least significant bits in the data bus concurrently acts as select addresses to an input multiplexer (U907).

U911 is an eight bit addressable output latch, serving the display driver (U913) and the optional tone signalling modules.

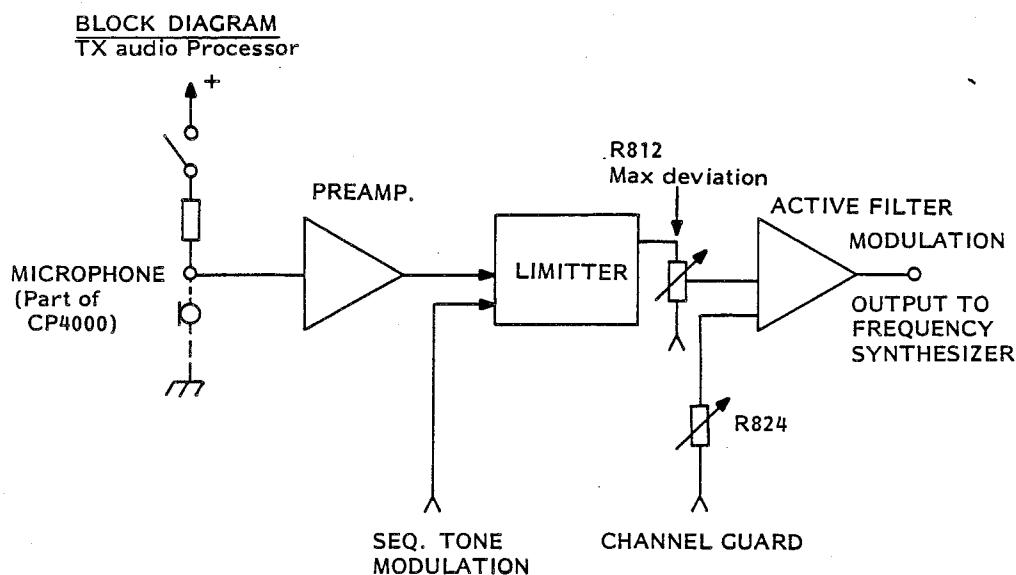

OTHER FUNCTIONS

BACK UP BATTERY CIRCUITRY B101, U903
and associated components

A lithium battery serves as back-up for the microcontroller data memory.

U903 is a dual comparator of which one gives a logic low-signal to the microcontroller when the battery voltage drops below the specified limit. The other comparator monitors the battery voltage to give a low-signal to start an emergency power down sequence. This to prevent excessive load on the back-up battery in case of improper removal of the main battery.

TX AUDIO PROCESSOR, U801 - Q802, 3, 4
and associated components

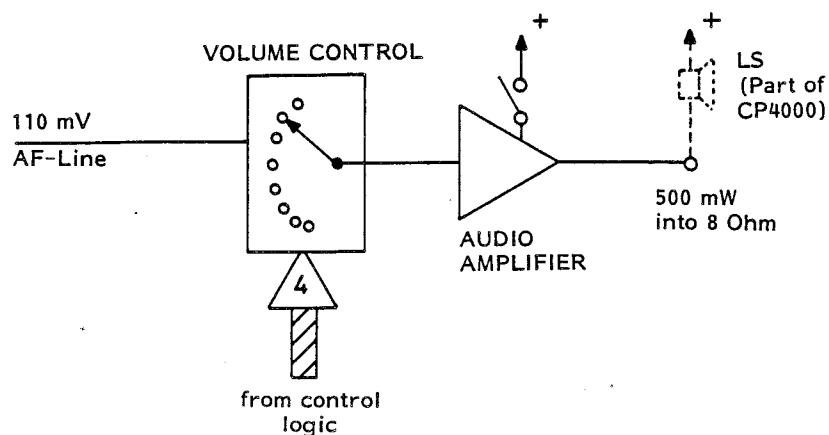

The audio processor consists of a dual operational amplifier (U801) performing the microphone preamplifier and the splatter filter, and a discrete limiter (Q802, Q803, Q804).

The audio processor contains 2 adjustment points R812 and R824 adjusting respectively: The maximum deviation and the optional channel guard tone deviation to be obtained on the transmitter frequency.

AUDIO OUTPUT AMPLIFIER AND VOLUME CONTROL
U701, Q701-Q702, U702 and associated components

BLOCK DIAGRAM
Audio output amplifier

The audio output amplifier consists of a single monolithic IC (U701) giving up to 500 mW output power.

The amplifier is switched off by Q701 and Q702 during stand by and transmit in order to squelch the radio and reduce the power consumption.

U701 is only under power when selected by the microcontroller via the output latch U906.

In connection with the audio amplifier, a digital controlled analog switch (U702) is performing the volume control with 8 selectable levels.

MICROPHONE CONTROL Q801, Q805

Q801 and Q805 controls the bias voltage to the microphone. "PTT" turns bias on if not overridden by tone signalling outputs.

OTHER FUNCTIONS

- ON/OFF
- Transmit signal
- Frequency synthesizer control
- Lock detect function
- Tone detect
- Battery control

CONNECTIONS DIAGRAM FOR CL4003

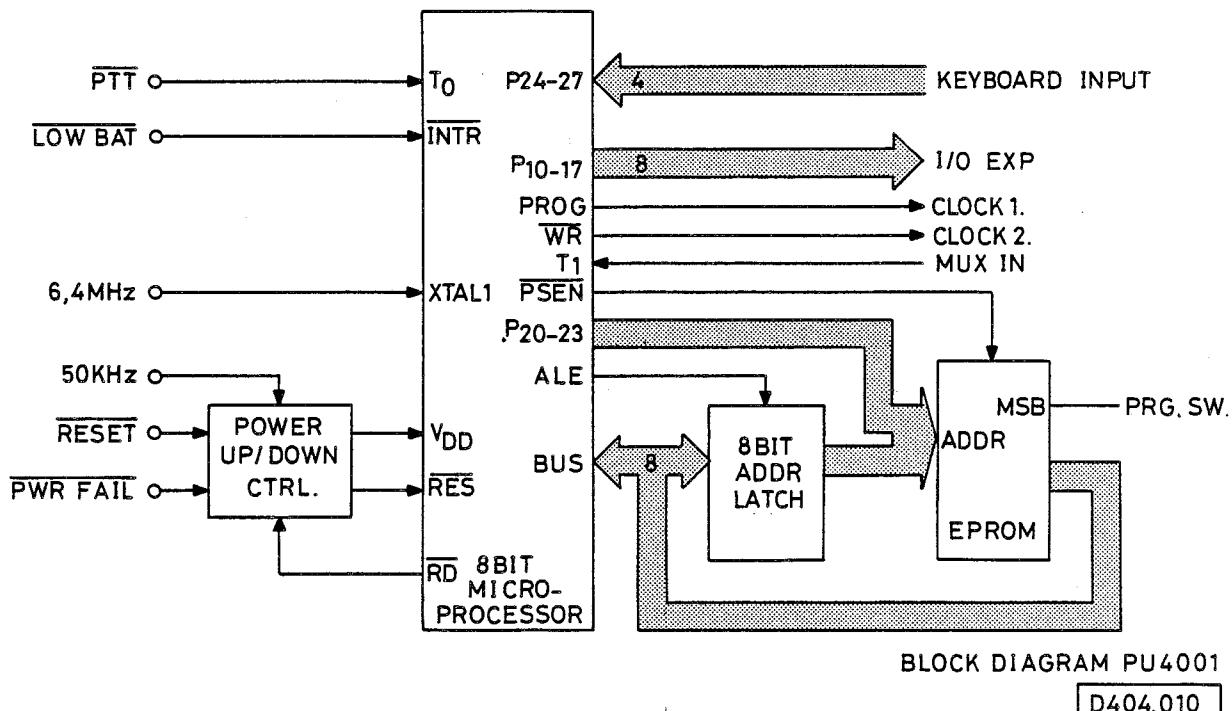

D 404.011

MICROCONTROLLER MODULE PU4001

PU4001 is a universal programmable microcomputer, integrate part of the control logic board CL4003.

PU4001 is a hybrid thickfilm microcontroller module based on a CMOS 8-bit singlechip micropo-

cessor 80C39 with external program memory. The module contains a socket for the program memory PROM plus the necessary interfacing circuitry. A circuit controls ON/OFF operation of the microprocessor.

CIRCUIT DESCRIPTION

MICROPROCESSOR U101

The 80C39 microprocessor uses the 6.4 MHz crystal oscillator situated on the RF board.

All timing and logical functions are processed by the software program except for power-up/down operation:

See Block Diagram D402..940/3.

EXTERNAL PROGRAM MEMORY XU101

XU101 is an 8K x 8 bit EPROM. It is divided into two separate memory banks, each 4K x 8 bit. The selection of each memory is made by a switch via the test connector.

Bank 0 (the lower) is reserved for the operational software while bank 1 is reserved for a standard program package designed for test and service support (see chapter: Test and service software).

All personality data related to the individual customer (RF-frequency codes, tone frequency, telegram specification) are programmed as a part of the operational software in the EPROM.

POWER CONTROL U102

The power-up/down is controlled by a bidirectional shift register, which is clocked by 50 kHz derived directly from 6.4 MHz.

The circuit assures maintenance of the RAM contents.

The flip-flop (U105b+c) gives the shift direction, partly hardware controlled and partly controlled by the microprocessor software.

INPUT/OUTPUT LINES

The microprocessor has 27 lines for input/output functions.

- Interface to external memory
DB0-DB7 (port 0) and P20 to P23 (lower half port 2)
- Keyboard input
P24-P27 (upper half port 2)
- To output expansion system
P10-P17 (port 1) with two signal lines Prog (pin 43) and WR (pin 28)
- To input expansion system
P10-P13 (lower half port 1) with one test input T1 (pin 16)
- Specific input signals
T0 (pin 18) and RD (pin 26)

CP4002

CONTROL PANEL

The control panel CP4002 is the interface between the operator and the radio set. CP4002 is used in the CQP4000 Automatic version (with CL4003). It consists of a moulded plastic front which holds the 16 button laminated keypad, the display-lens, the loudspeaker, and the microphone. Electrical connections are made through two flexible tails.

MATRIX TABLE

KEY \ LINE	D	C	B	A	D 0	D 1	D 2	D 3
	11			x	x			
12				x		x		
13			x					x
14			x				x	
21		x			x			
22		x				x		
23		x						x
24		x					x	
31	x				x			
32	x					x		
33	x							x
34	x						x	
41	x				x			
42	x					x		
43	x							x
44	x						x	

The control panel consists of a bottom layer and a top layer each equipped with a flexible tail. These tails are connected to the CL-board via J905. By depressing a key a message is sent through the two layers. The bottom layer sends an impulse directly to the microcontroller PU4001 and the top layer sends an impulse to the output expander U905.

The above table shows which lines are activated when depressing a specific key. For instance, if key number 23 is depressed an impulse is sent through pin D3 of the bottom layer via connector J905 and directly to pin 4 af PU4001, and through pin B of the toplayer to pin 4 of the output expander U905.

INTERCONNECTIONS FOR SWITCHES S3 AND S4

The following covers the interconnections between the switches S3 and S4 in CB400x and the CQP4000 Automatic radio.

Fig. 1

Function	Lines
a	C/D2
b	B/D2
c	A/D2
d	A/D3

Fig. 2

Four functions from the keyboard positions: a, b, c, and d, can be implemented in the control box, yet only two in the same box.

Fig. 1 shows the position of the functions on the keyboard.

The functions are obtained by connecting the lines from CQP4000 Automatic as shown in fig. 2.

The possible combinations of the functions together with the combination of wires, CB version and group numbers can be seen on diagram D404. 008

TQ4009

PROGRAMMABLE TONE MODULE

The tone module TQ4009 is a combined tone transmitter/tone receiver unit which is universal programmable and used in connection with the control logic board CL4003 in the CQP4000 Automatic version. The TQ4009 functions only in connection with the CL4003 control logic or a similar board which is capable of programming the tone module, controlling the transmitters and handling the detected outputs.

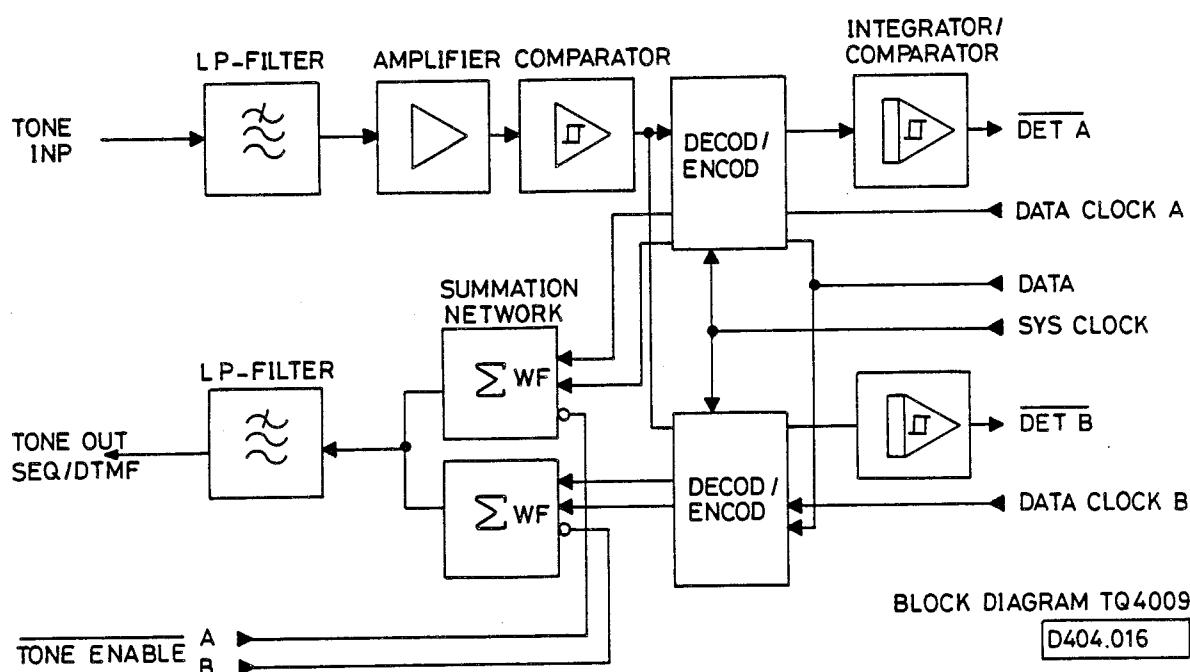

The TQ module is built around a DTD chip (Digital Tone Decoder) which is to be considered as a programmable digital filter. The peripheral circuitry consists of a limiter which shapes input signals and an integrator at the detect output which ensures proper detection.

A summation network is used to generate the output signal from two square waves from the DTD, known as Walsh Functions.

When the TQ is used as a tone encoder the summation network is enabled from the control logic via connector J905, pins 10 and 11. The final signal is filtered before being applied to the TX audio processor on the CL-board through pin 16 on J905.

TQ4009 has two DTD substrates to be able to generate dual tone signals. The circuit is not suitable for decoding dual tones.

All connections to the TQ module are through connectors J904 and J905.

TQ TONE DATA LOADING

A system clock signal from the control logic is fed to the circuit through J904, pin 7. The system clock frequency is derived from 6,4 MHz and 200 kHz is chosen.

The DTD is programmed by serially loading 15 bits of information through DTD Data and clocked on the positive edges of DTD STB (CLOCK A and CLOCK B).

The first 5 bits determine the Q-value of the tone circuit and the last 10 bits program the frequency. The threshold is programmed with the Thresh Sel A, -B inputs to be -8,5 dB.

The data clock inputs (CLOCK A-B) must return low as the chip is reset when high.

TONE RECEPTION

Tones are received through J904, pin 5. From this pin the tone passes a 2-pole active low-pass filter built around OP-amp U101A. It is then amplified by a factor 10 in U101B and finally limited through comparator U102A.

The output from the limiter is sent to the detect inputs of the DTD's, U103 and U104. If the DTD, which is to be considered as a programmable digital filter, accepts the signal to be equivalent to the programmed tone, the detect output goes HIGH.

To ensure a reliable detect acknowledge, an integrator/comparator, U102B-U106B, is processing the DTD detect output. The delayed detect output from this integrator/comparator is active LOW.

TONE ENCODING

The DTD decode and encode simultaneously. This means that the programmed resonant frequency is present on the tone outputs.

The encode signal is built-up by two square-wave signals, the so-called Walsh Function bits. This tone is proportionally summed by a pair of TRI-state buffers, U105, and the corresponding resistor network. The result of the summed Walsh Function bits is fed through a second order active low pass filter with 0 dB gain.

If DTMF tones are wanted an extra load resistor, R134, is switched on to keep the voltage swing at the rated value.

The encode tone signal output is fixed at the level fit for the CL4000 board.

CQP4000 UNIVERSAL

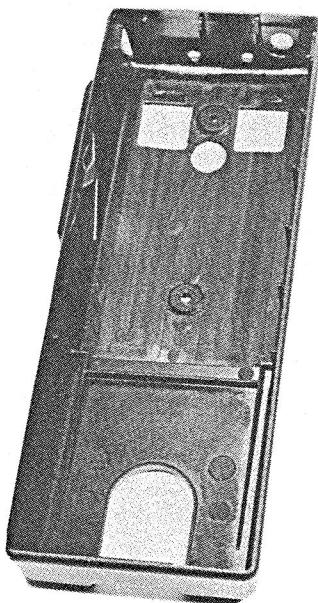

REMOTE CONTROL

The remote control is connected to the CQP4000 by an 11 cored multi-connector terminating cable.

The installation demands a special cabinet, CA4003.

A threaded hole, placed between the two cut-aways, secures the multiconnector terminating the multicable from the remote control box CB400x.

If no multiconnector is used a protective cover protects the contacts.

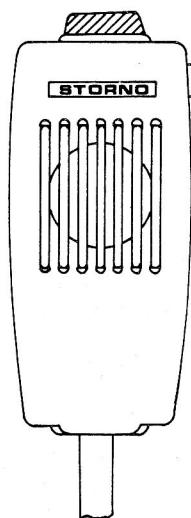

This cabinet is provided with two cut-aways, each giving access to five contact surfaces from a female multiconnector. These 10 contacts are connected to the bottom terminals on a chassis, CH4003, by means of a flexible wiring board being part of the chassis.

As a special option an earphone socket can be mounted on the control box.

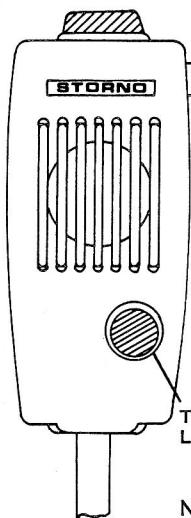

The remote control, when connected to the CQP4000, transfers the loudspeaker and microphone facilities to the control box whereby the loudspeaker/microphone in the CQP4000 is switched off.

NOTES:

- LS ON/OFF: includes squelch cancel
- G-No's in () cover types with headphone connector added
- Length of multicable - measured between connector and CB is 800 mm

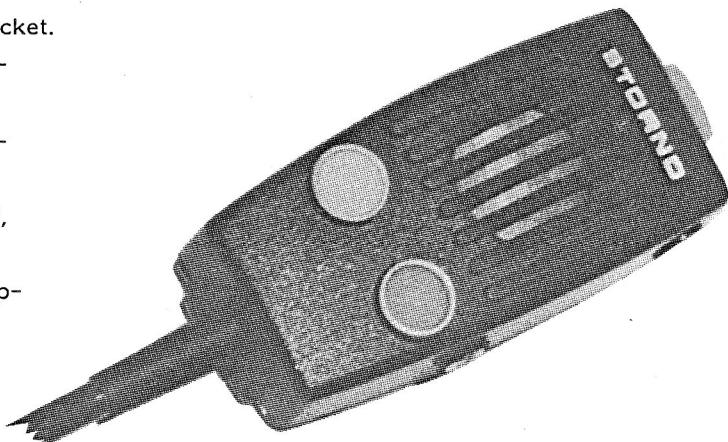

To order a CQP4000 with remote control, CQP4000U, please select "U" under digit no. 7. See nomenclature for further information concerning type specification of the radio.

CB4001 contains loudspeaker/microphone, transmitter key, and, optionally, earphone socket.
Application: CQP4000 without tone equipment or CQP4000U automatic version.

CB4002 contains loudspeaker/microphone, transmitter key, one extra push button controlling either tone keying or LS ON/OFF, and, optionally, earphone socket.
Application: CQP4000U without tone equipment, and all versions of CQP4000U for special control purposes.

CB4003 contains loudspeaker/microphone, transmitter key, two extra push buttons one controlling the tone key and one controlling LS ON/OFF, and optionally earphone socket.

Application: CQP4000U with tone equipment.

CIRCUIT DESCRIPTION

The amplifier consists of a self stabilizing input amplifier, Q101, with DC feedback. It is followed by an emitter follower, Q102, which provides for a low output impedance. This is necessary to attenuate (~ 30 dB) the signal from the internal microphone in the CQP4000 radio.

The amplifier has a low pass filter characteristic with 3 dB frequency at 7.2 kHz and a 6 dB/oct.

roll off. It is designed on discrete components to obtain the best possible chance to avoid distortion caused by RF radiation from the radio.

A transistor switch, Q103, feeds the 7.2V supply voltage to the amplifier during TX. Components related to earphone and loudspeaker are also included on the board.

CQP4000 UNIVERSAL ACCESSORIES

CK4008

CK4008 is a leather carrying case designed for BU4001 application with cut-aways for the multi-connector used with the remote control.

CK4009

CK4009 is a leather carrying case intended for BU4002 application with cut-aways for the multi-connector used with the remote control.

19K805738G1

This part number designates a complete earphone socket kit (including mounting instructions).

19M906065G1

This is a remote multiconnector with an 11-cored shielded multicable of approx. 900 mm mounted.

K19J709305G1

This is a kit for changing an existing standard CQP4000 into a universal version. The kit includes modification instructions and new labels to be filled-in.

MISCELLANEOUS

ANTENNAS

Whip antenna AN4661

This antenna is for the frequency band 400-470 MHz.

Rubber antenna AN4xx2

The AN4112 is a wide band conductive rubber antenna.

AN4332 is a rubber antenna existing in two versions: AN4332-L (low band) for 68-76 MHz and AN4332-H (high band) for 75-88 MHz.

Preadjusted, resonant helical antenna AN4xx3

This antenna exists in five versions, A to E, fitted for five sub-bands in the 146 to 174 MHz frequency range.

The adjustment to the sub-band is done by cutting the length.

SUB-BAND DESIGNATION	RANGE MHz
A	145-155
B	150-160
C	155-165
D	160-170
E	165-175

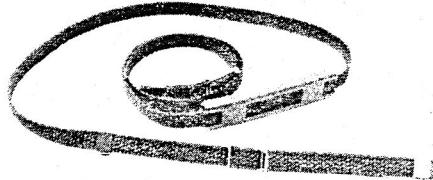

OTHER ACCESSORIES

Carrying strap CK4003

The carrying strap is delivered as a kit containing:

1. Strap (leather)
2. Buckles
4. Clamps
1. Shoulder protector

It is possible to cut the strap to any length and therefore to use it as a wrist-strap.

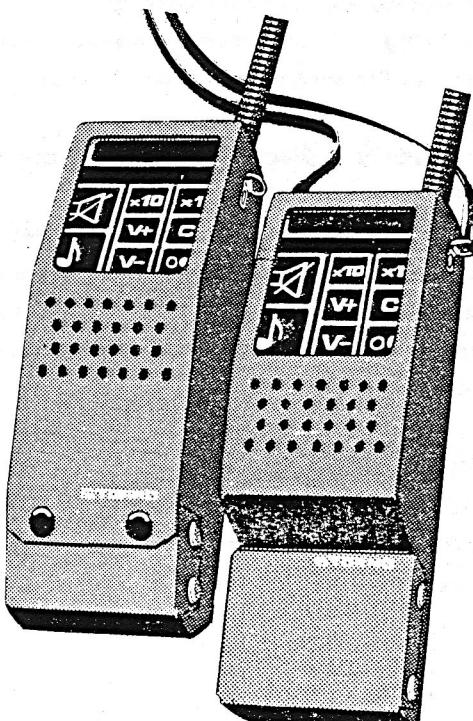

Carrying cases CK4004 and CK4005

The two carrying cases are in black leather. CK4004 is for the BU4001 battery version of the CQP4000 and CK4005 is for a CQP4000 with BU4002.

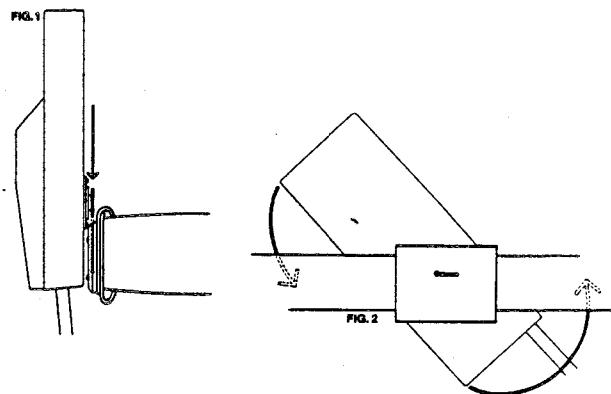

The display and the keypad are accessible through a transparent window in the case as well as there are four rows of holes for the loudspeaker. A separate flap allows the battery to be charged without removing the radio from the case.

The carrying cases may be used together with the carrying strap.

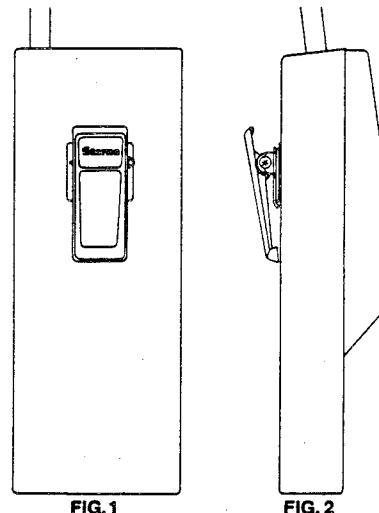

Belt retainer CK4006.

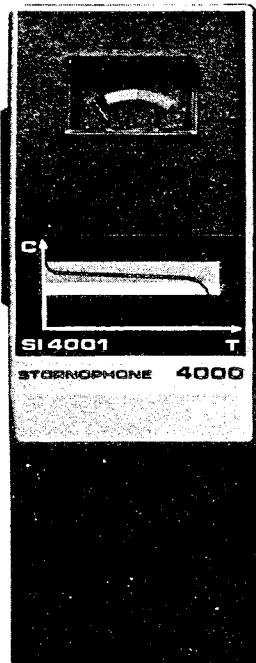

In order to fasten the belt retainer a special plast cabinet, CA4002, must be ordered. The retainer consists of a bracket to mount on CA4002 and a leather ring with a swivel lock. With the belt loop in position the radio shoe is pushed upside down into the receiver, turned 180° where it locks and cannot be removed unless you reverse the procedure.

Belt clip CK4007.

To fasten the belt clip the special plast cabinet, CA4002, must be ordered. The clip is made of stainless steel. It has a shoe which locks into the receiver mounted on the back of the radio

Battery tester SI4001

The battery tester is based on mechanical parts used for the radio-package. A moving-coil instrument is placed in the front part, in the area normally used for the key-pad. The battery is placed in the battery compartment. When the button on the left side (normally used for PTT) is depressed, the battery is loaded corresponding to the 2 W transmitter and the instrument will show the charge-condition.

Display and keypad cover

A plastic cover to protect the display and keypad from being scratched by tools, etc. is available.

BU4001/BU4002

BATTERIES

The battery unit BU4001/BU4002 is intended for use in STORNOPHONE 4000 radiotelephones.

The battery pack consists of 2 moulded plastic parts, contact-strips and 6 NiCd-cells connected in serie.

2 sizes of batteries are provided as options. A 450 mAh battery and a larger, 750 mAh battery. The nominal battery voltage is 7.2 V. The batteries are provided with two sets of terminals, one set in the top giving the supply to the radio and one set in the back for charging purposes. The charge - terminals are short circuit protected by means of a diode mounted in the battery. This enables the unit to be charged separately or when in the radio.

Because of the big area of the charging terminals, a diode is connected between the positive terminal and the battery in order to avoid short-

circuits when handling the battery. Furthermore, because the battery shall supply the charging unit in case of mains drop-out, a 470 ohm resistor is coupled parallel to the diode.

The third terminal (in the middle) of the charging inlet is designed for another version of the battery.

NOTE:

A new battery may not reach full capacity until it has been charged/discharged 2 to 3 times.

After a longer period of storing, the capacity of the battery can be lower than its nominal capacity.

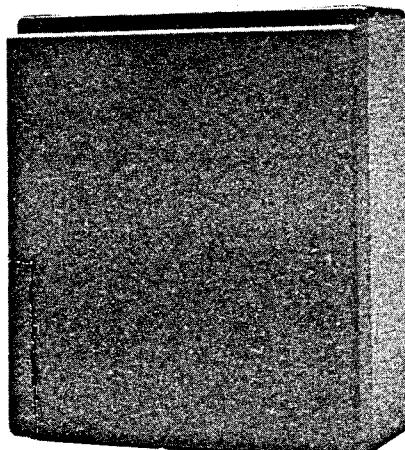

The battery must be started up, i.e. used with a few full charge/deep discharge cycles. Using the battery with full charge/deep discharge cycles from time to time will avoid storage and memory effects. A deep discharge corresponds to 6 V.

BU4001, 450 mAh

The operating time for a fully recharged battery is shown below (100% of nominal capacity):

Duty cycle %			Oper. * time	Standard type 2 & 10 ch.		Automatic type	
Transm.	Receive	Stand-by		1 W	2 W	1 W	2 W
2	5	93	Hrs	10.7	8.9	8.7	7.6
5	5	90	Hrs	8.4	6.1	7.3	5.6
5	10	85	Hrs	7.7	5.7	6.8	5.3
10	5	85	Hrs	6.3	4.0	5.7	3.9
10	10	80	Hrs	5.3	3.8	5.4	3.8

* Values shown for VHF. UHF values approx. 7% lower.

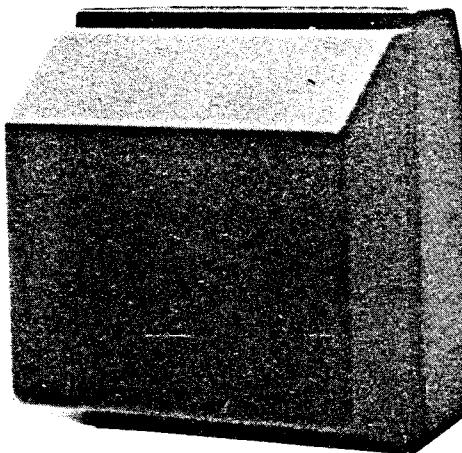

BU4002, 750 mAh

The operating time for a fully recharged battery is shown below (100% of nominal capacity):

Duty cycle %			Oper. * time	Standard type 2 & 10 ch.		Automatic type	
Transm.	Receive	Stand-by		1 W	2 W	1 W	2 W
2	5	93	Hrs	17.1	15.0	14.4	12.6
5	5	90	Hrs	14.1	10.3	12.1	9.3
5	10	85	Hrs	12.9	9.6	11.3	8.9
10	5	85	Hrs	10.4	6.7	9.6	6.5
10	10	80	Hrs	9.8	6.4	9.1	6.3

* Values shown for VHF. UHF values approx. 7% lower.

TECHNICAL SPECIFICATIONS

BU4001Capacity:

450 mAh nominal at 25°C.

Voltage:

7.2 V nominal at 25°C.

Charging current:

Max. 135 mA.

Charging temperature:

10 to 45°C.

Discharge temperature:

-25 to +60°C.

Storage temperature:

-40 to +60°C.

Internal resistance at 25°C:

DC resistance: 0.4 ohm max

AC resistance: 0.3 ohm max.

Dimensions

Length: 67.2 mm

Width: 67.4 mm

Height: 21.0 mm

Weight

150 g

BU4002Capacity:

750 mAh nominal at 25°C.

Voltage:

7.2 V nominal at 25°C.

Charging current:

Max. 250 mA.

Charging temperature:

10 to 45°C.

Discharge temperature:

-25 to +60°C.

Storage temperature:

-40 to +60°C.

Internal resistance at 25°C:

DC resistance: 0.225 ohm max

AC resistance: 0.17 ohm max.

Dimensions

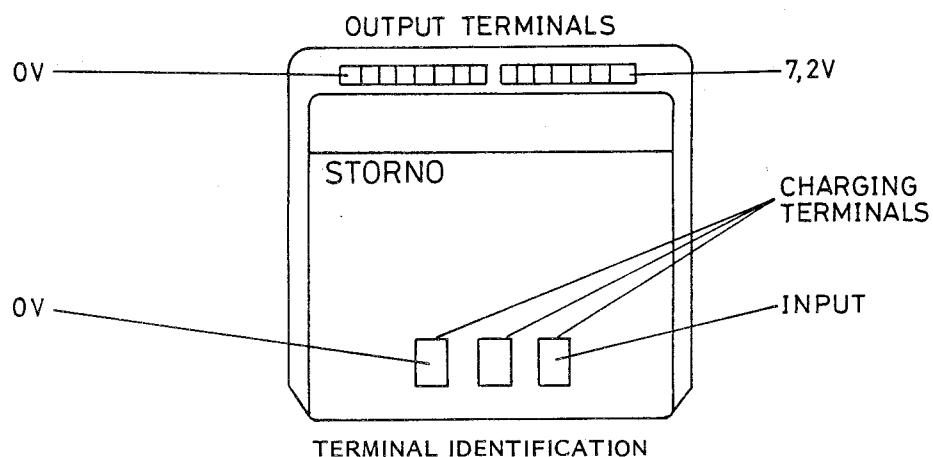

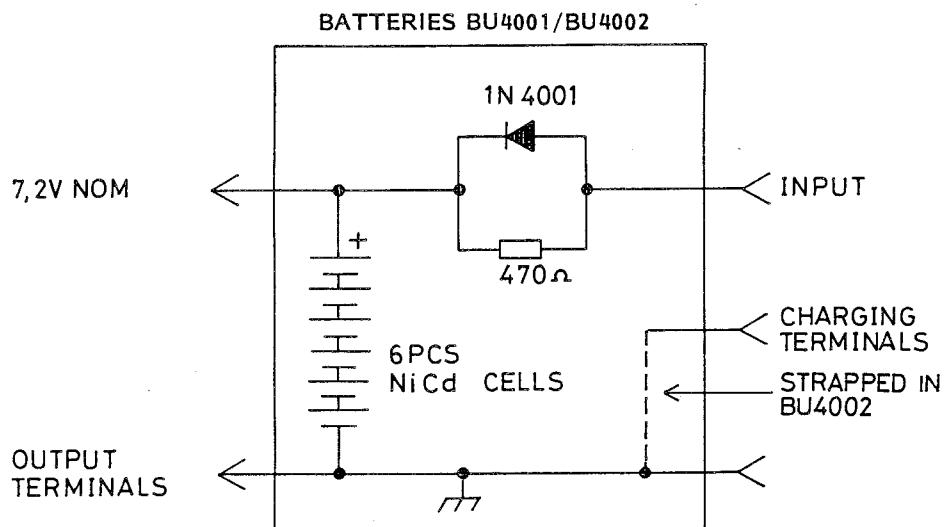

Length: 67.2 mm

Width: 67.4 mm

Height: 36.5 mm

Weight

BU4001/BU4002

D403.315/3

CU4001/CU4002

BATTERY CHARGERS

The CU4001 and CU4002 battery chargers are designed for the NiCd batteries BU4001 (450 mAh) and BU4002 (750 mAh).

The chargers are available in a standard version and UK version with a special mains plug containing fuses.

The chargers provide charging of either the battery alone or when inserted in the radio.

The chargers are fully automatic, and the charging time is approximately:

- o 450 mAh battery - 6 hours
- o 750 mAh battery - 10 hours

A red light emitting diode placed in the cabinet front indicates that the charging unit is connected to mains power supply.

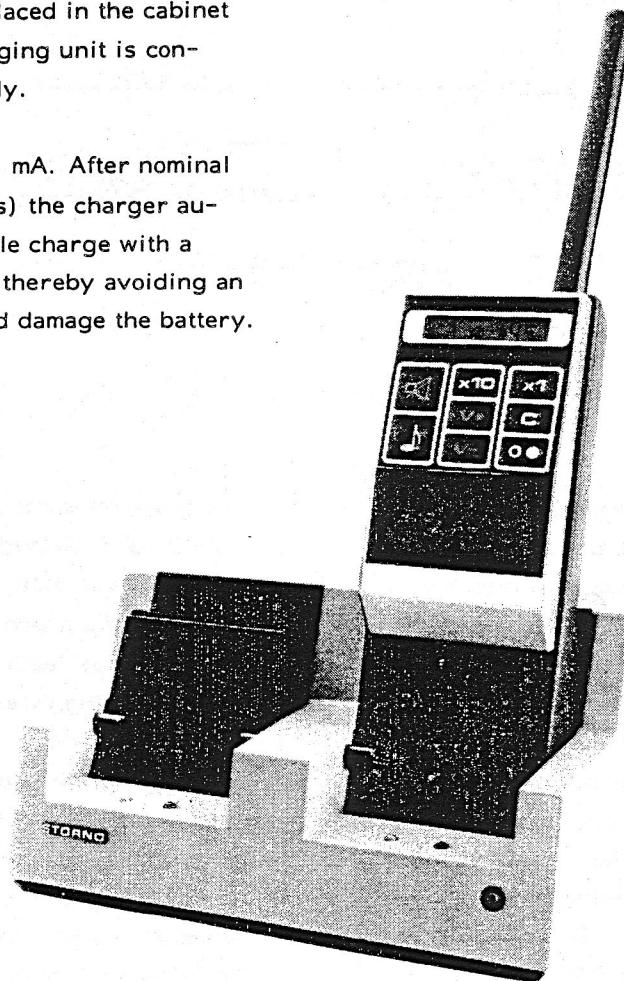

The charging current is 120 mA. After nominal charging time (6 or 10 hours) the charger automatically switches to trickle charge with a charging current of 38 mA, thereby avoiding an overload condition that could damage the battery.

The battery contains a coding terminal, which automatically programs the charger for the right charging time so that the charger need not be adjusted to charge the two different battery types.

CU4001 is designed with two outlets, each provided with two LED-indicators.

- o Yellow LED - charging in process.
- o Green LED - charging finished.

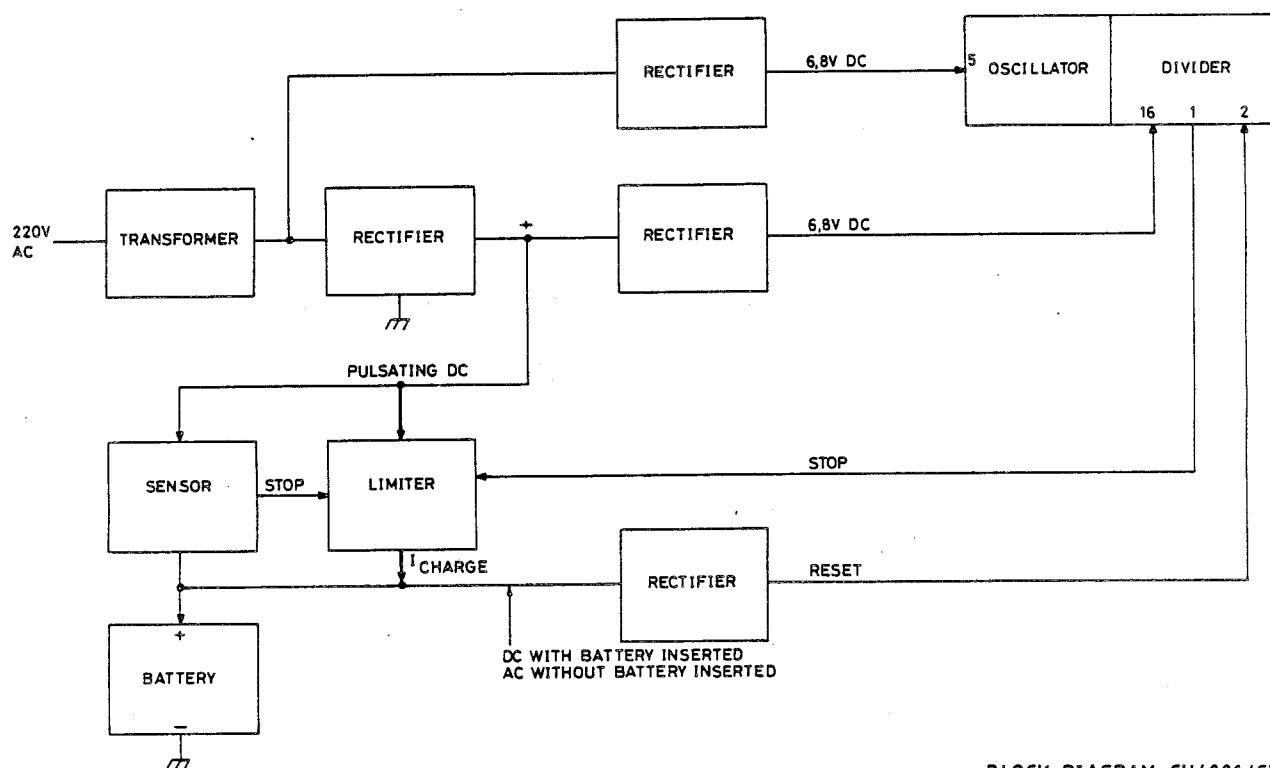

CU4002 is a 6 position unit consisting of the same basic parts as the 2 position charger CU4001. 3 component boards with mains transformer and 3 cabinets are placed side by side on one common bottom plate. The boards are therefore functionally identical to the 2 position charger.

CIRCUIT DESCRIPTION

The charger comprises identical circuits, one for each outlets. The charging current is a rectified alternating current (100/120 Hz). The output AC voltage from the mains transformer is rectified and fed to the battery through a current limiting circuitry consisting of a zener diode (D201-D301) and a power transistor (Q201-Q301) providing a

constant peak voltage drop across two series coupled resistors (R203/211-204, R303/311-304). R204/304 is short circuited during the predetermined period of quick charging. R203/211, R303/311 thereby determine the quick charge rate. The standby charge rate is determined by the series combination of the three resistors.

BLOCK DIAGRAM CU4001/CU4002

D403.314/2

The timing circuit U201-U301, consists of a clock pulse oscillator and a divider for each outlet. The oscillator is only supplied from the mains transformer (Pin 5). The divider is supplied from the mains transformer and from the inserted battery (Pin 16), in order to maintain information of the elapsed quick charge time and to stop oscillation in case of mains dropout. The output voltage is limited to 11.5 V peak. The proper functioning of the timer is ensured by a resetting circuitry sensing whether there is an alternating voltage or a DC voltage at the battery outlet (Q203, D206, R212, R213). The

reset input of the frequency divider is at pin 2. Each outlet is provided with a yellow LED-indicator (H201-H301) to show that charging is in process and a green LED (H202-H302) to show that battery is ready after the predetermined quick charging time.

When a 750 mAh battery is inserted into the charger an extra contact strip in the battery connects a capacitor (C202) in the charger to ground whereby the oscillator frequency is lowered to prolong the charging time. The charger is short-circuit protected.

TECHNICAL SPECIFICATIONS

NOTE: All charge currents are mean values.

Supply voltage

220/240VAC, +10%, -15% 50/60 Hz.

Mains transformer primary is strapped to either
220 V or 240 V nom.

Input current

Max. 45 mA

Input power

Max. 11 W

Temperature range

10 - 45 deg.C

Output voltage

$U_{max.} = 11.5 \text{ Vpeak}$

Quick charge current at 220 V

min: 105 mA

TEST ADAPTOR

SE4002

The test adaptor is designed with the same dimension as a battery and fits into the battery compartment. The adaptor can be used to connect various test instruments to the radio and has built-in toggle switches to operate the radio during test and when adjusting the circuitry.

7.2 V CABLE

A cable terminated in two banana plugs, one red and one black, connects to the external power supply whose nominal output voltage should be +7.2 V.

AF OUT CABLE

A coaxial cable terminated in a BNC plug is used to measure the receiver AF output, either the line output (nominal 110 mV) or the loudspeaker output, dependent on the setting of the AF-LINE switch.

MOD. IN CABLE

A coaxial cable terminated in a BNC plug connects to an AF generator for external modulation of the transmitter. The test adaptor has a built-in 11:1 attenuator and the nominal modulation sensitivity as measured at the generator output is 110 mV/1 kHz

TOGGLE SWITCHES

KEY

switches between receive mode RX and transmit mode TX.

AF-LINE

switches the AF out cable between the line output and the loudspeaker output.

AF

switches the AF receiver output between the internal loudspeaker INT and a built-in 8 ohm dummy load.

SQ

switches between the normal SQUELCH function and the unsquelched condition CANCEL.

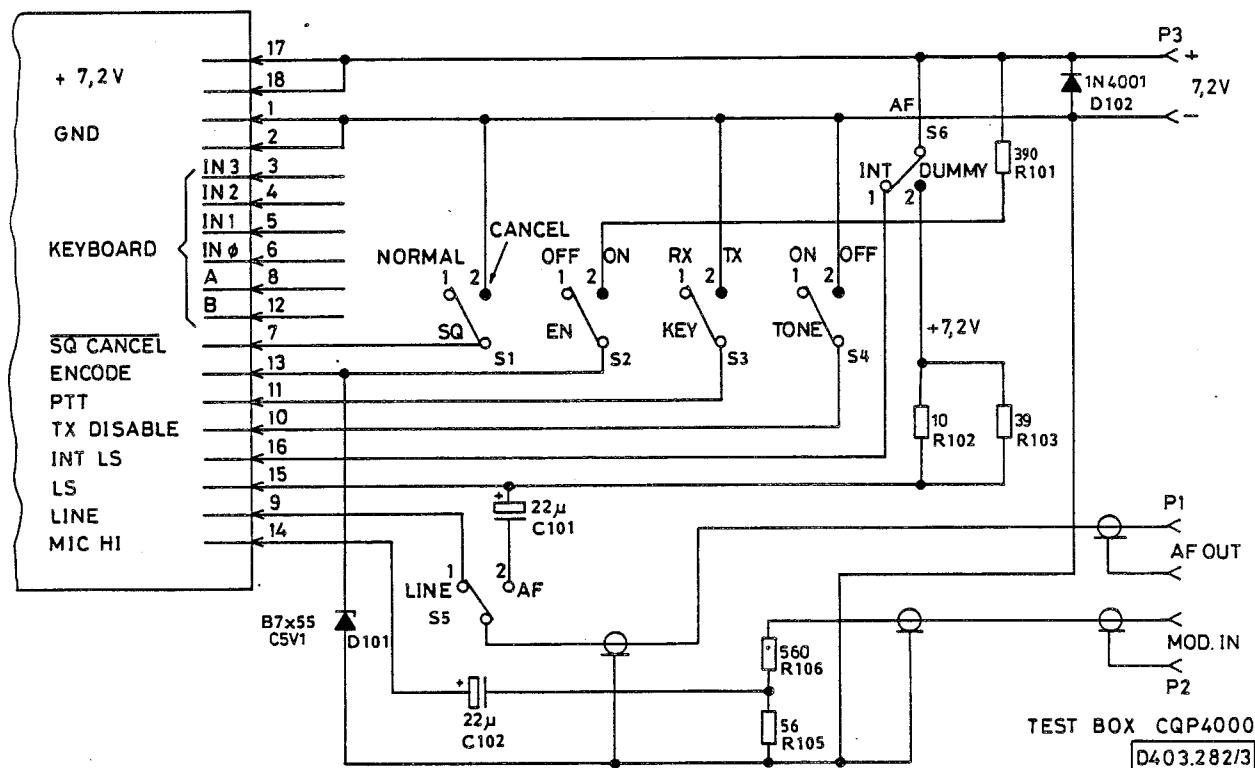

EN and TONE

are switches which when manipulated as described below key the transmitter and continuously modulate it with the first tone of the tone receiver code. The EN switch should always be in OFF position and the TONE switch in ON position unless the tone module is being tested.

The following procedure sets up the tone test mode:

1. Turn radio OFF
2. Set KEY to RX
3. Set EN to OFF
4. Set TONE to ON
5. Turn radio ON
6. Set TONE to OFF
7. Set KEY to TX
8. Set TONE to ON
9. Set EN to ON

The radio will now be in transmit mode and continuously modulated with a frequency which is the first tone of the tone receiver telegram code.

STORNOPHONE 4000 AUTOMATIC

ADJUSTMENT PROCEDURE

RF BOARD ADJUSTMENTS

For adjustment of the RF board refer to the appropriate description:

RF411x - 60.617-E3

RF433x - 60.778-E2

RF466x - 60.779-E2

TEST SETUP

When the radio has been dismantled it should be fixed in service equipment SE4005 with the Control Panel CP4002 connected, or assembled in the test cabinet with extension cables and the test adapter SE4002. Note that the operation of the radio is totally different in the service mode.

SERVICE MODE SOFTWARE

The Stornophone 4000 Automatic software has an inherent test program which can be invoked when the radio is set up for test and alignment. In service mode the radio can be operated on 3 channels:

Channel 1: A lower pair of the user frequencies (RX/TX)

Channel 2: A pair of calculated center frequencies

Channel 3: The higher pair of the user frequencies

Channel 2 may necessarily not be a user channel but is included for alignment purposes as to optimize performance.

To invoke the service mode set the SE4002/SE4005 toggle switches as follows:

<u>SWITCH</u>	<u>POSITION</u>
EN	OFF
TONE	OFF
SQ	NORMAL
AF	INT
AF-LINE	LINE
KEY	RX

60.995-E1

When the radio is turned on it will be in SERVICE MODE.

IMPORTANT

Don't change the setting of the EN and TONE switches while the radio is in service mode as this will result in an undefined condition of program execution. If this is done accidentally it will not harm the radio set but the operation will be in an uncontrollable state. The only way to clear the situation is to remove the DC power to the radio.

SERVICE MODE OPERATION

The service mode has two operating levels, 1 and 2.

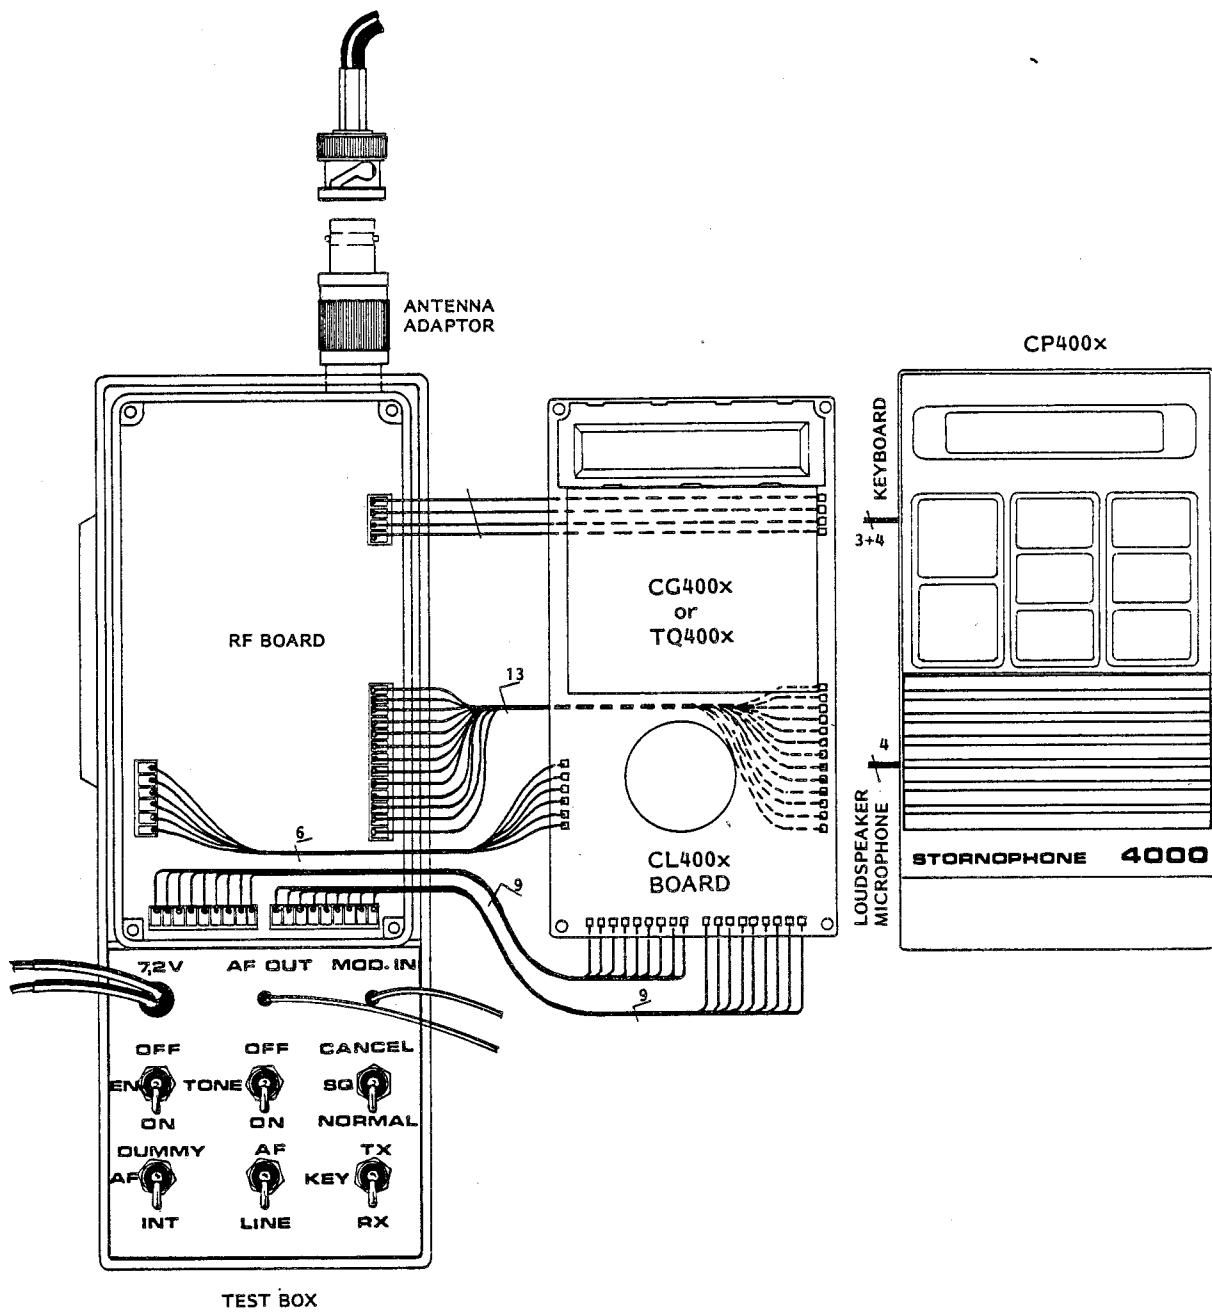

- | | |
|----------------|--|
| <u>Level 1</u> | is used for RF test (channel select), setting the volume and selecting the tone mode. Level 2 is entered by pressing the ON/OFF button. |
| <u>Level 2</u> | is used for display test (LCD), Keyboard test, Squelch ON/OFF, Encode/Decode switch of subunit 0 and 1 (TQ4009) and continuous side tone ON/OFF. |

The Service Mode Keyboard configurations appear from fig. 1, 2 and 3.

TONE SUBUNIT TEST (TQ4009)

The Tone Subunits 0 and 1 (TQ4009) can be tested for DECODE and ENCODE. In ENCODE-phase a capital letter "E" is indicated in the display for the pertinent tone subunit.

When a correct tone is decoded (detected) a "small" letter "d" is indicated in the display.

**TEST SETUP
STORNOPHONE 4000 AUTOMATIC****D403.279/3**

Please note: This tone subunit test is a single tone test, not sequential. In EN-CODE-mode the transmitter is permanently and automatically keyed with a single continuous AF-signal. In ENCODE-mode it is further possible to transmit a true (continuous) DTMF (Touch-tone or Double-tone signal). It is not possible in DE-CODE-mode to decode (detect) a DTMF-signal.

The Tone Loading-Codes are listed below.

<u>Display code</u>	<u>CCITT DTMF (norm.)</u>
15	697 Hz
16	770 Hz
17	852 Hz
18	941 Hz
19	1209 Hz
20	1336 Hz
21	1475 Hz
22	1633 Hz

Display codes

> 22	Will be ignored
------	-----------------

TONE LOADING CODES

<u>Display-code</u>	<u>CCIR no.</u>	<u>Frequency (norm.)</u>
00	0	1981 Hz
01	1	1124 Hz
02	2	1197 Hz
03	3	1275 Hz
04	4	1358 Hz
05	5	1446 Hz
06	6	1540 Hz
07	7	1640 Hz
08	8	1747 Hz
09	9	1860 Hz
10	G	2400 Hz
11		930 Hz
12		2247 Hz
13		991 Hz
14	R (Repeat)	2110 Hz

TONE MODULATION ADJUSTMENT

Connect a frequency deviationmeter to the antenna connector.

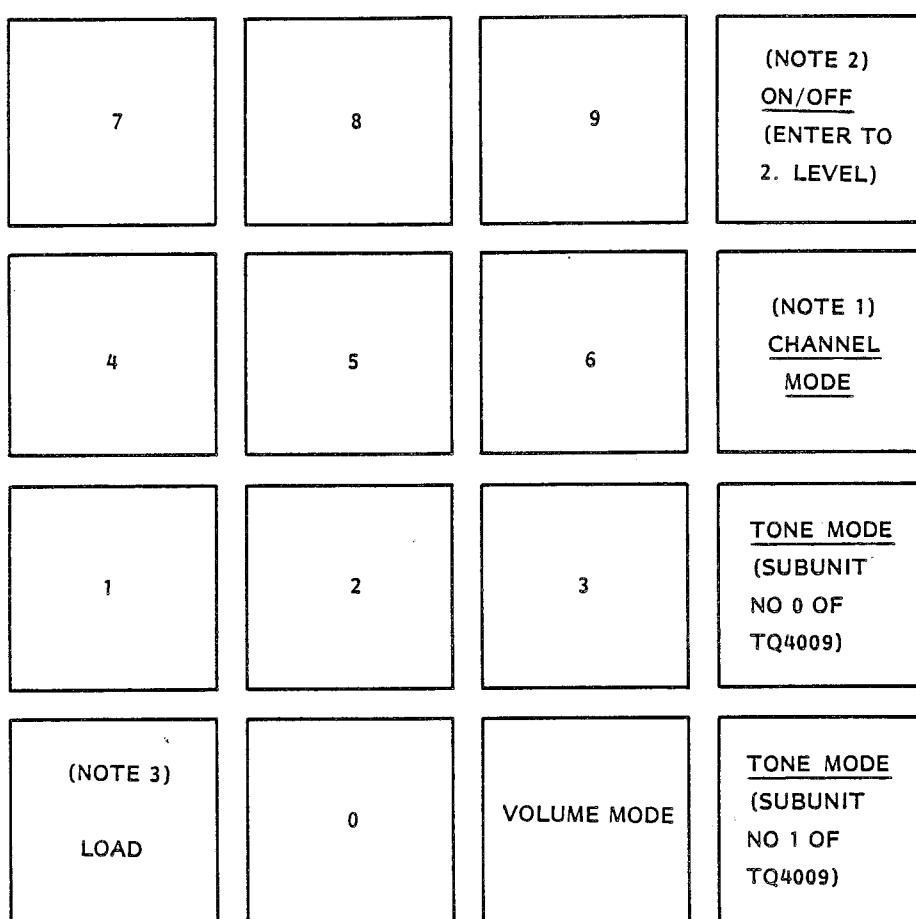

Enter service mode level 2 and turn the side tone on. The transmitter will automatically be keyed.

Adjust R824 for 3.5 kHz deviation.

KEYBOARD CONFIGURATION

FIG. 1

SERVICE MODE 1. LEVEL

NOTE 1: In service mode only 3 RF channels can be accessed,
CH1 = lowest user RF frequency (RX and TX)
CH2 = center RF frequency (RX and TX)
CH3 = highest RF user RF frequency (RX and TX)

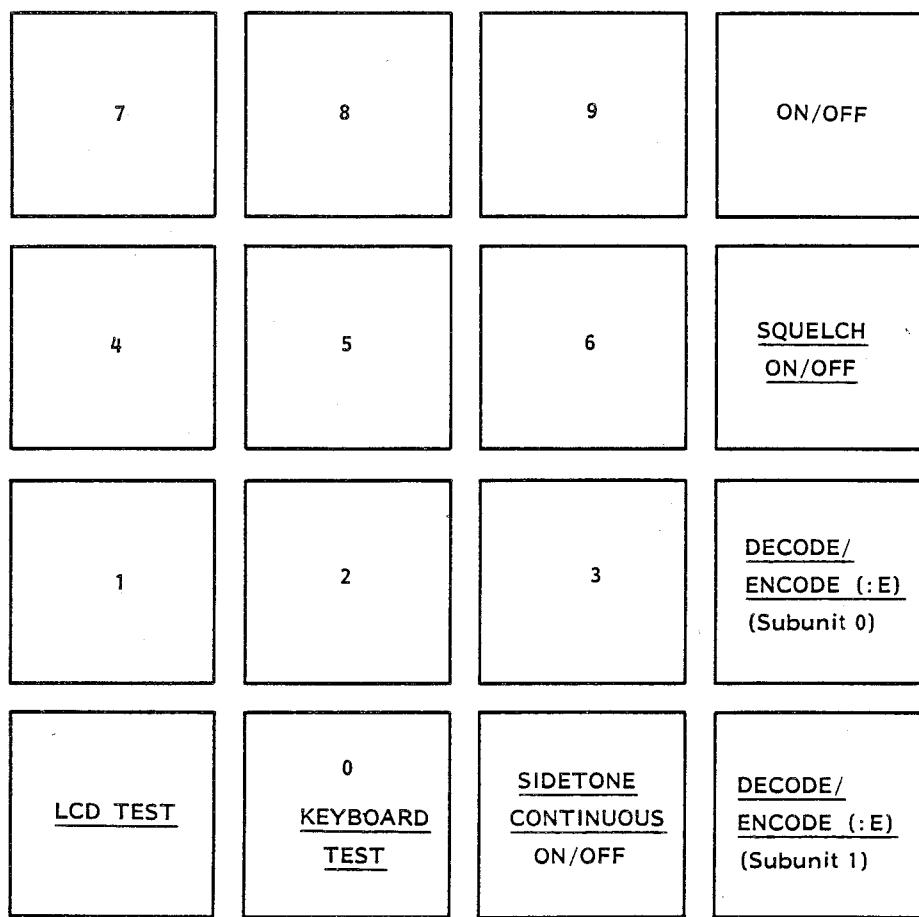

NOTE 2: After pressing this button once the set will be in the 2nd service mode for approx. 5 seconds.

NOTE 3: Load, i.e.: enter channel number or AF-tone.

KEYBOARD CONFIGURATION

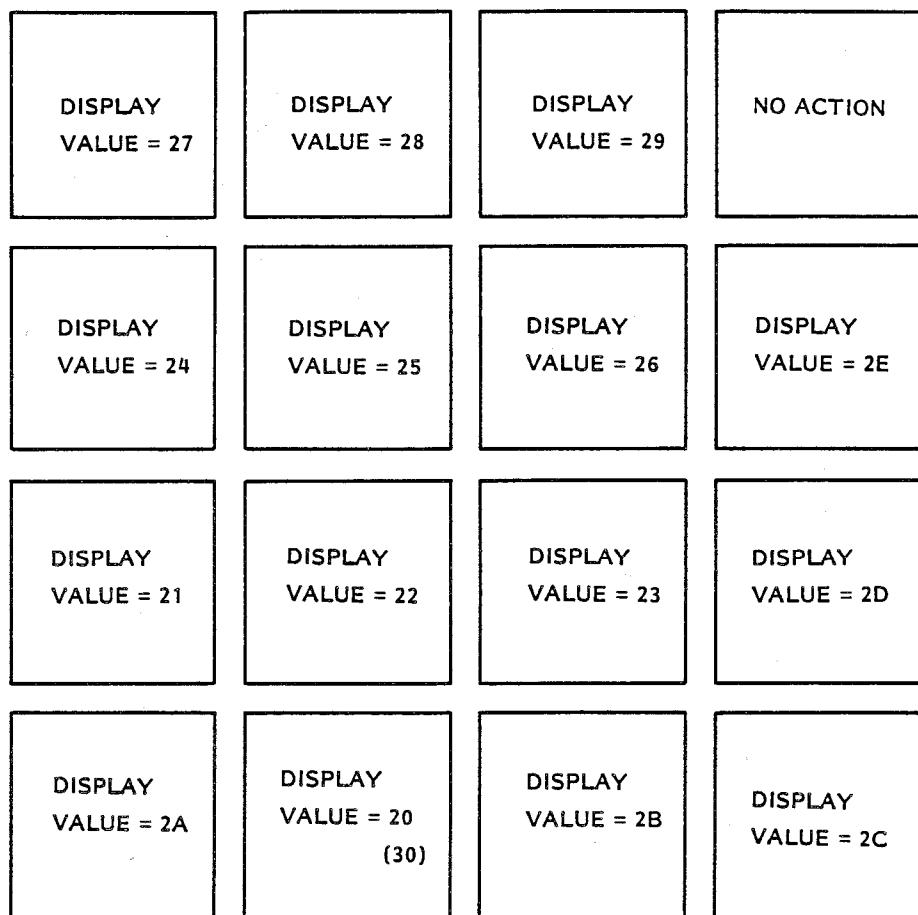

SERVICE MODE 2. LEVEL

FIG. 2

KEYBOARD TEST

FIG. 3

NOTE:

The first digit indicates the test level

The second digit indicates the HEX value
of the pertinent keyboard field.

ADJUSTMENT PROCEDURE

CQP4110

This adjustment procedure applies to the following types of STORNOPHONE 4000 radios:

CQP4112: 146-174 MHz - 25 kHz channel spacing
 CQP4113: 146-174 MHz - 20 kHz channel spacing
 CQP4114: 146-174 MHz - 12.5 kHz channel spacing

Before making adjustments to the radio circuit, read the type label and note the channel frequencies and the tone system coding.
 Also check the personality PROM and its data against the type label information.

MEASURING INSTRUMENTS

The following measuring instruments are necessary for making service and adjustments to the CQP4110:

RF Signal Generator	146-174 MHz
AF Voltmeter	$Z_i > 0.5 \text{ Mohm}$
Multimeter	20 Kohm/V
Distortion meter	
Deviation meter	
Watt meter	0-2.5 W
AF Generator 50 Hz-5 kHz	$Z_{out} \geq 600 \text{ ohm}$
Frequency counter	5-200 MHz/50 mV
Power Supply	6-10 V/2 A
Signal Sampler	Storno D52
RF diode probe	Storno 95.0059-00
RF coil tuning tool	Storno 17.0053-00
Ref. oscillator tuning tool	Storno 19J707496G1

Test adaptor	SE4002 19K805371G1
Service kit	SE4003 19J707744G1
Consisting of service cabinet and antenna adaptor	
Extension cables	CC4001 19J707704G1

DISMANTLING OF CQP4000

Before the CQP4000 can be adjusted the radio must be dismantled for access to all test points and adjustable components.

- Remove the battery, if inserted.
- Remove the two rear screws holding the cabinet.
- Remove the chassis box.
- Remove the four corner screws holding the front.
- Open the chassis box, carefully, without damaging the contact fingers on the rim.
- Take the CL400x board and the RF4110 board apart.
- Connect the CL400x board to the RF4110 board by means of the extension cables.
- Insert the chassis box in the service cabinet and firmly press the RF board to the bottom of the chassis box to establish good ground connections.
- Attach the antenna adaptor.
- Insert the test box in the battery compartment.
- The STORNOPHONE 4000 is now prepared for adjustment.

TRANSMITTER ADJUSTMENT

Refer to transmitter test setup.

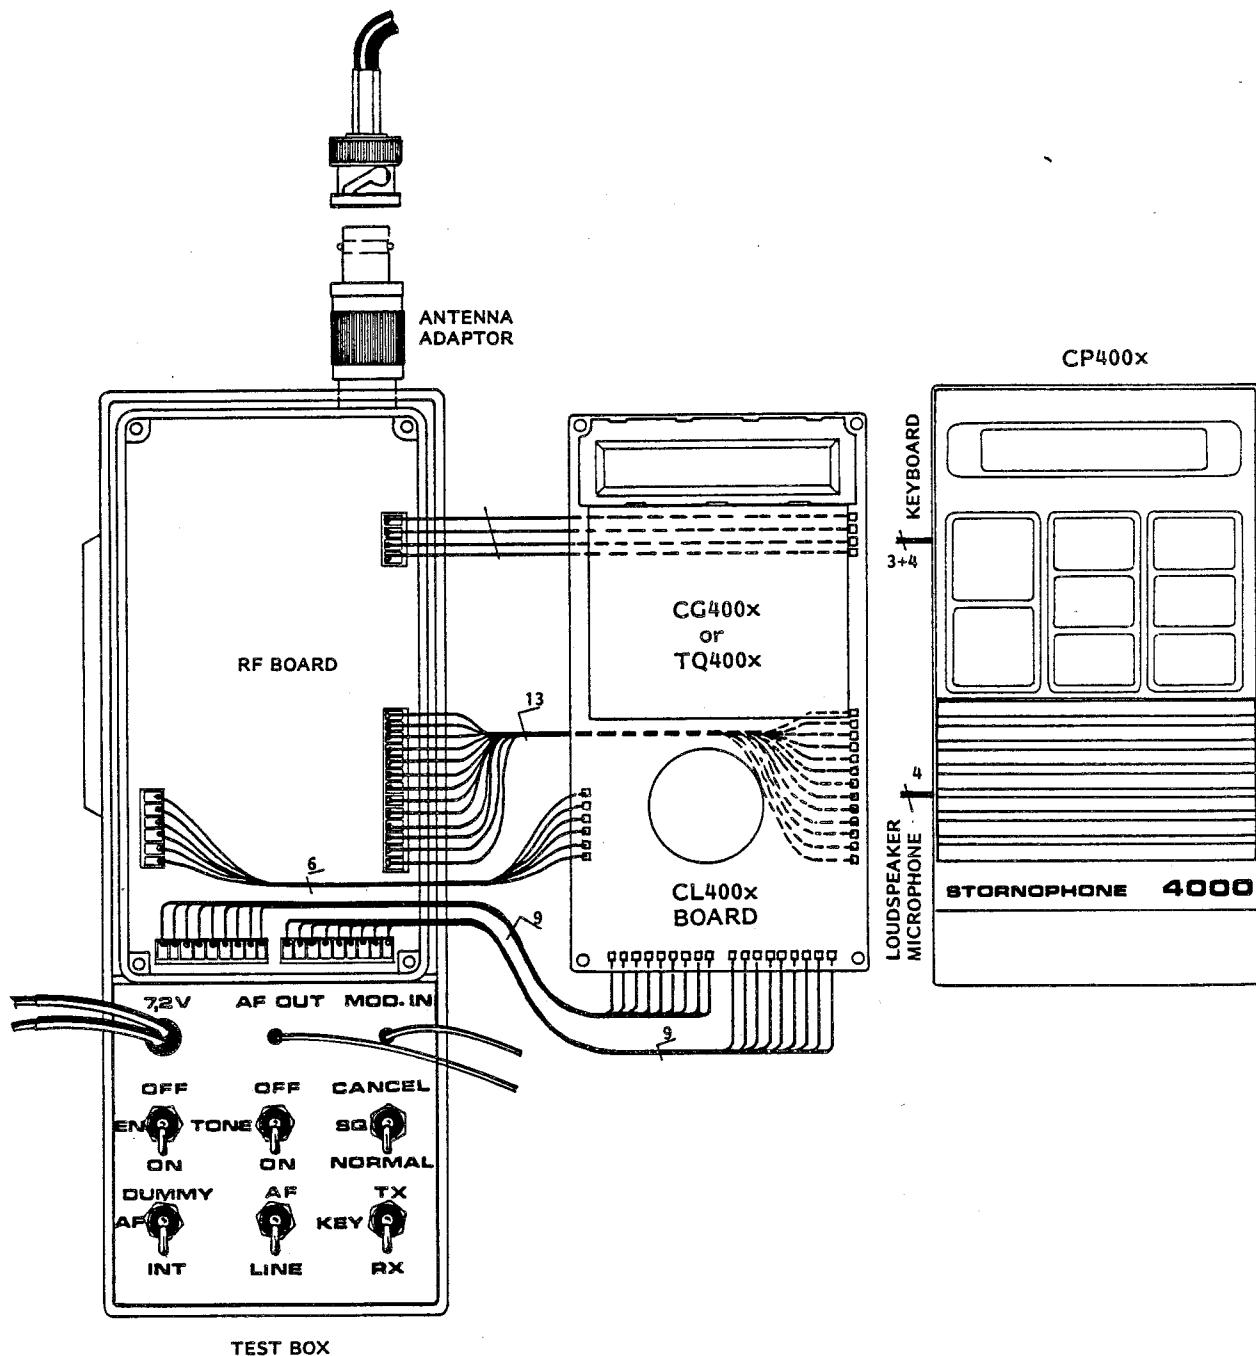

Set the power supply voltage to 7.2 V.

Turn the radio on in receive mode and measure the current consumption.

Requirement: less than 30 mA.

Connect the voltmeter to the +5.5 V test point.

Read the 5.5 V regulated voltage.

TEST SETUP
STORNOPHONE 4000

D403.279/3

1. SYNTHESIZER REFERENCE FREQUENCY ADJUSTMENT

Connect the frequency counter to P3 pin 13-CLOCK.

Read the reference frequency.

Check the reference crystal's frequency (6.4 MHz or 6.5 MHz).

Adjust C533 for $f_{\text{nom}} \pm 10$ Hz.

Note:

The final adjustment of the reference frequency is performed later with closed chassis box.

2. TRANSMITTER VCO ADJUSTMENT

Set the ADC potentiometer to minimum, anti-clockwise.

Key the transmitter and read the current drain. Requirement: less than 1 A.

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.

Adjust C504 for 0 V steady ready reading on the voltmeter. Connect the voltmeter to TP4.

Adjust C504 for a reading of 3 Volts. Adjust C504 so that the reading for each channel is inside the tuning range, 1 - 4 V. The channel with the lowest frequency has the lowest voltage reading.

3. TRANSMITTER POWER OUTPUT ADJUSTMENT

Connect the wattmeter to the antenna connector. Adjust ADC potentiometer R115 for rated output power according to the type designation.

Note:

The current drain at rated output power must not exceed 1 A.

4. TRANSMITTER FREQUENCY ADJUSTMENT

Connect the wattmeter to the antenna connector through the signal sampler.

Connect the frequency counter to the signal sampler.

Key the transmitter and read the frequency.

Adjust C533 for correct frequency. (C533 is fine adjusted later with closed chassis box).

Requirement: $F_{\text{nom}} \pm 0.2$ ppm (30 Hz at 150 MHz)

Deenergize the transmitter.

Select next channel

Key the transmitter and check for correct output frequency for each channel.

NOTE:

Adjustment of the transmitter frequency which also adjusts the receiver for correct frequency is done later when the chassis box is closed.

5. TRANSMITTER MODULATION ADJUSTMENT

Connect the deviation meter to the signal sampler.

Connect the AF generator to MOD IN on the test box.

Set the AF generator frequency to 1000 Hz and the output as follows:

1100 mV with test box (11:1 built-in attenuator)

Vary the AF frequency between 100 Hz and 3000 Hz and find peak deviation. Check the frequency for both + and - deviation. At the frequency producing peak deviation adjust R812 for maximum system deviation.

CQP4112: ± 5 kHz

CQP4113: ± 4 kHz

CQP4114: ± 2.5 kHz

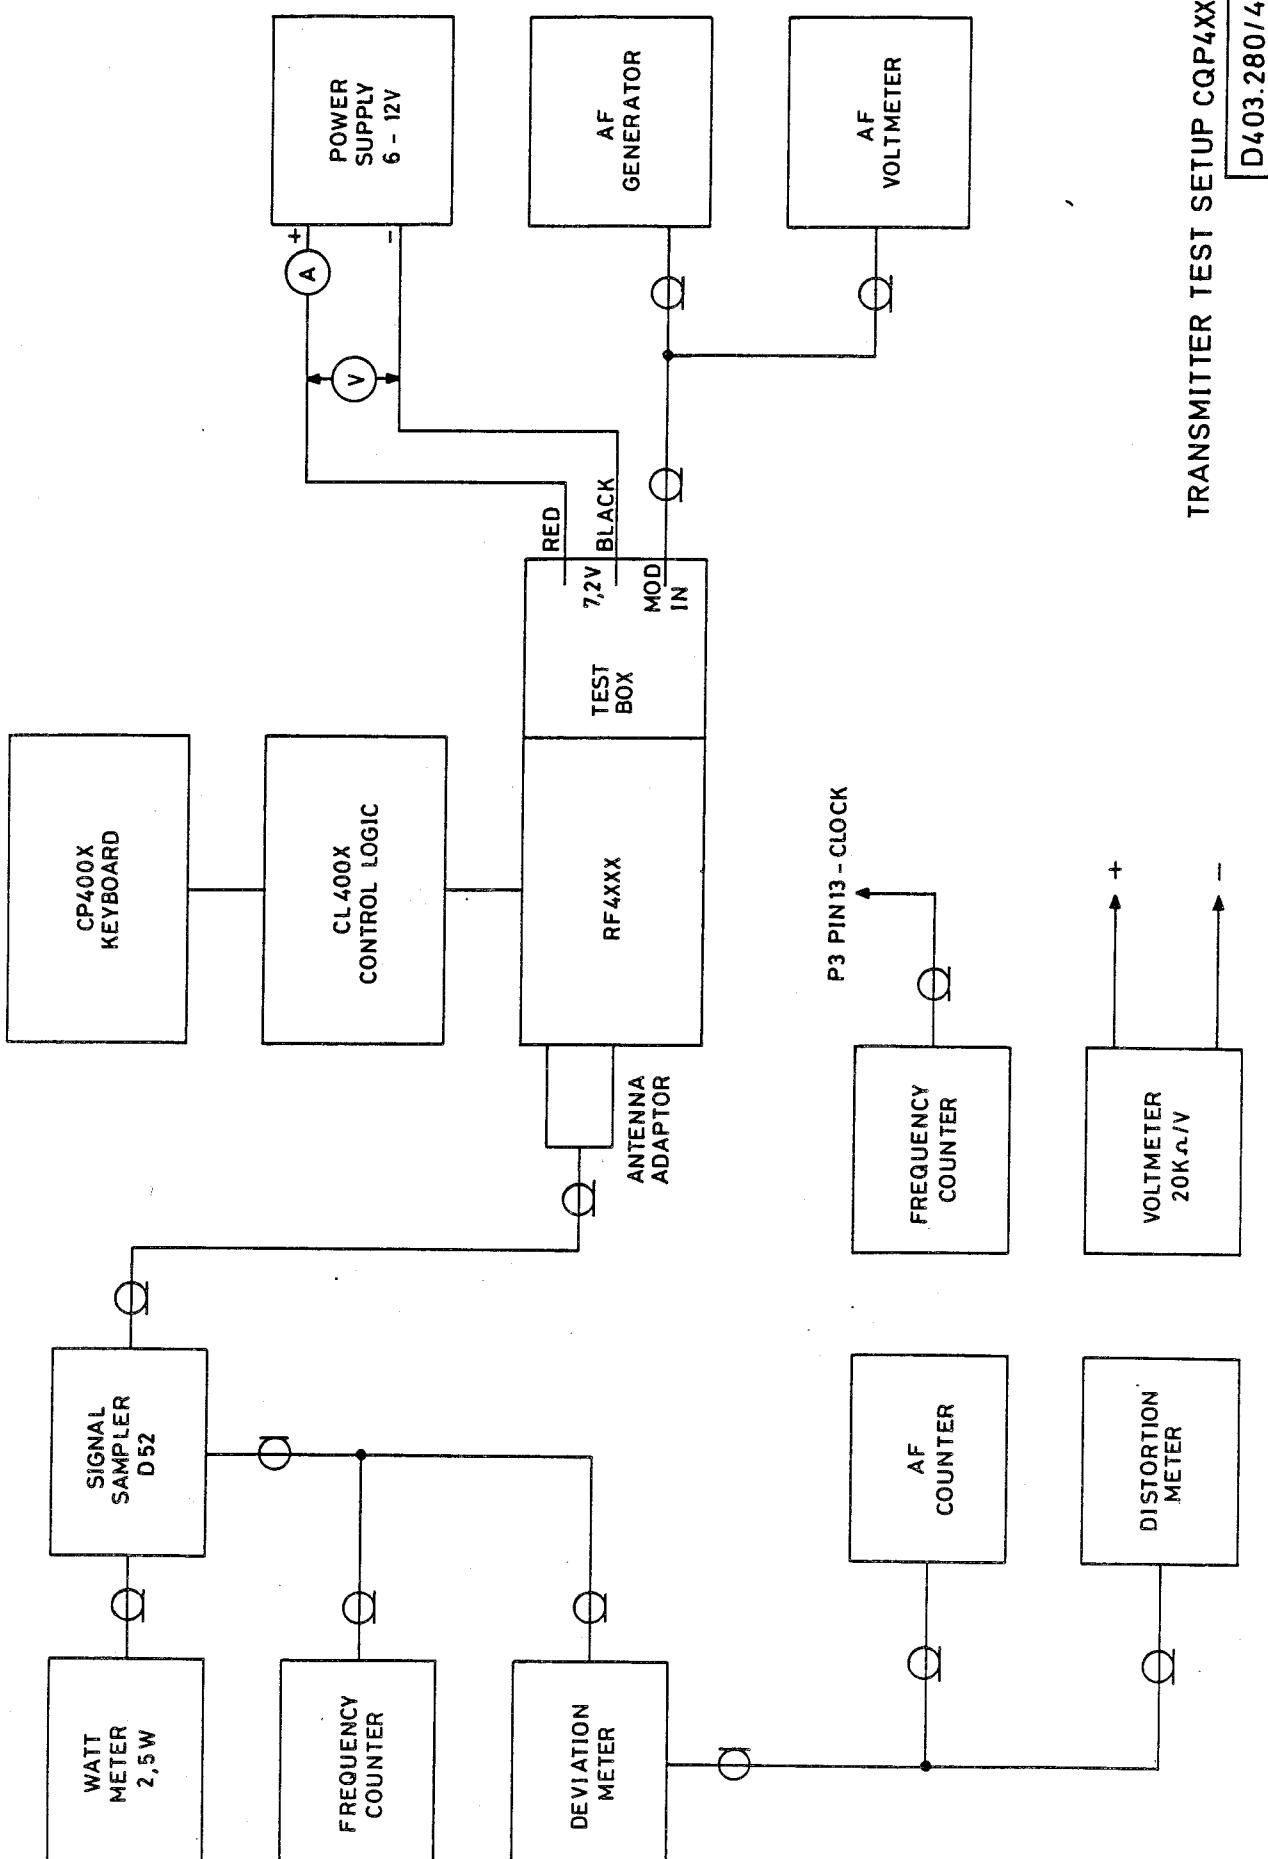

Set the AF generator frequency to 1000 Hz. Reduce the AF generator output until a deviation of $0.7 \times$ maximum deviation is obtained:

CQP4112: ± 3.5 kHz

CQP4113: ± 2.8 kHz

CQP4114: ± 1.75 kHz

Typical generator output is 100 mV.

RECEIVER ADJUSTMENT

Refer to receiver test setup.

1. RECEIVER VCO ADJUSTMENT

Connect the voltmeter to P3 pin 7, OUT OF LOCK signal.

Preset coil L508 as follows:

High end of band: 2/3 out of coil.

Low end of band: Fully down in coil form.

Set SQ switch to cancel.

Adjust C514 for 0 V steady reading on the voltmeter. Connect the voltmeter to TP4.

Adjust C514 for a reading of 3 Volts. Adjust C514 so that the reading for each channel is inside the tuning range, 1 - 4 V.

The channel with the lowest frequency has the lowest voltage reading.

2. RECEIVER INJECTION SIGNAL ADJUSTMENT

Connect the diode probe and the voltmeter to TP2.

Adjust L508 for maximum voltmeter reading, $0.2 \text{ V} \pm 0.1 \text{ V}$. (L508 is readjusted together with the front-end).

3. IF SIGNAL ADJUSTMENT

Connect the signal generator to the antenna connector and set it to the channel frequency.

Modulate the signal generator with 1000 Hz to $0.7 \times$ maximum system deviation.

CQP4112: $\pm 3.5 \text{ kHz}$

CQP4113: $\pm 2.8 \text{ kHz}$

CQP4114: $\pm 1.75 \text{ kHz}$

Set the signal generator output to 100 mV.

Connect the diode probe and the voltmeter to TP3.

Reduce the signal generator output until voltage reading is less than 1 V.

Adjust L402 and L308 for maximum voltmeter reading.

Connect the AF voltmeter to AF OUT. Set the signal generator output to 100 mV.

Adjust L403 for maximum voltmeter reading.

ALTERNATIVE PROCEDURE

Connect the distortion meter to AF OUT.

Adjust L403 for minimum distortion.

4. AF LINE LEVEL ADJUSTMENT

Connect the AF voltmeter to the AF OUT (J906 pin 14).

Set signal generator as described in paragraph 3.

Adjust R409 for a voltmeter reading of 110 mV $\pm 5 \text{ mV}$.

5. FRONT-END ADJUSTMENT

Connect the signal generator to the antenna connector and set its frequency to the channel frequency.

Modulate the signal generator as described in paragraph 3. Adjust the generator output to approx. 12 dB SINAD.

Connect a distortion meter to AF OUT.

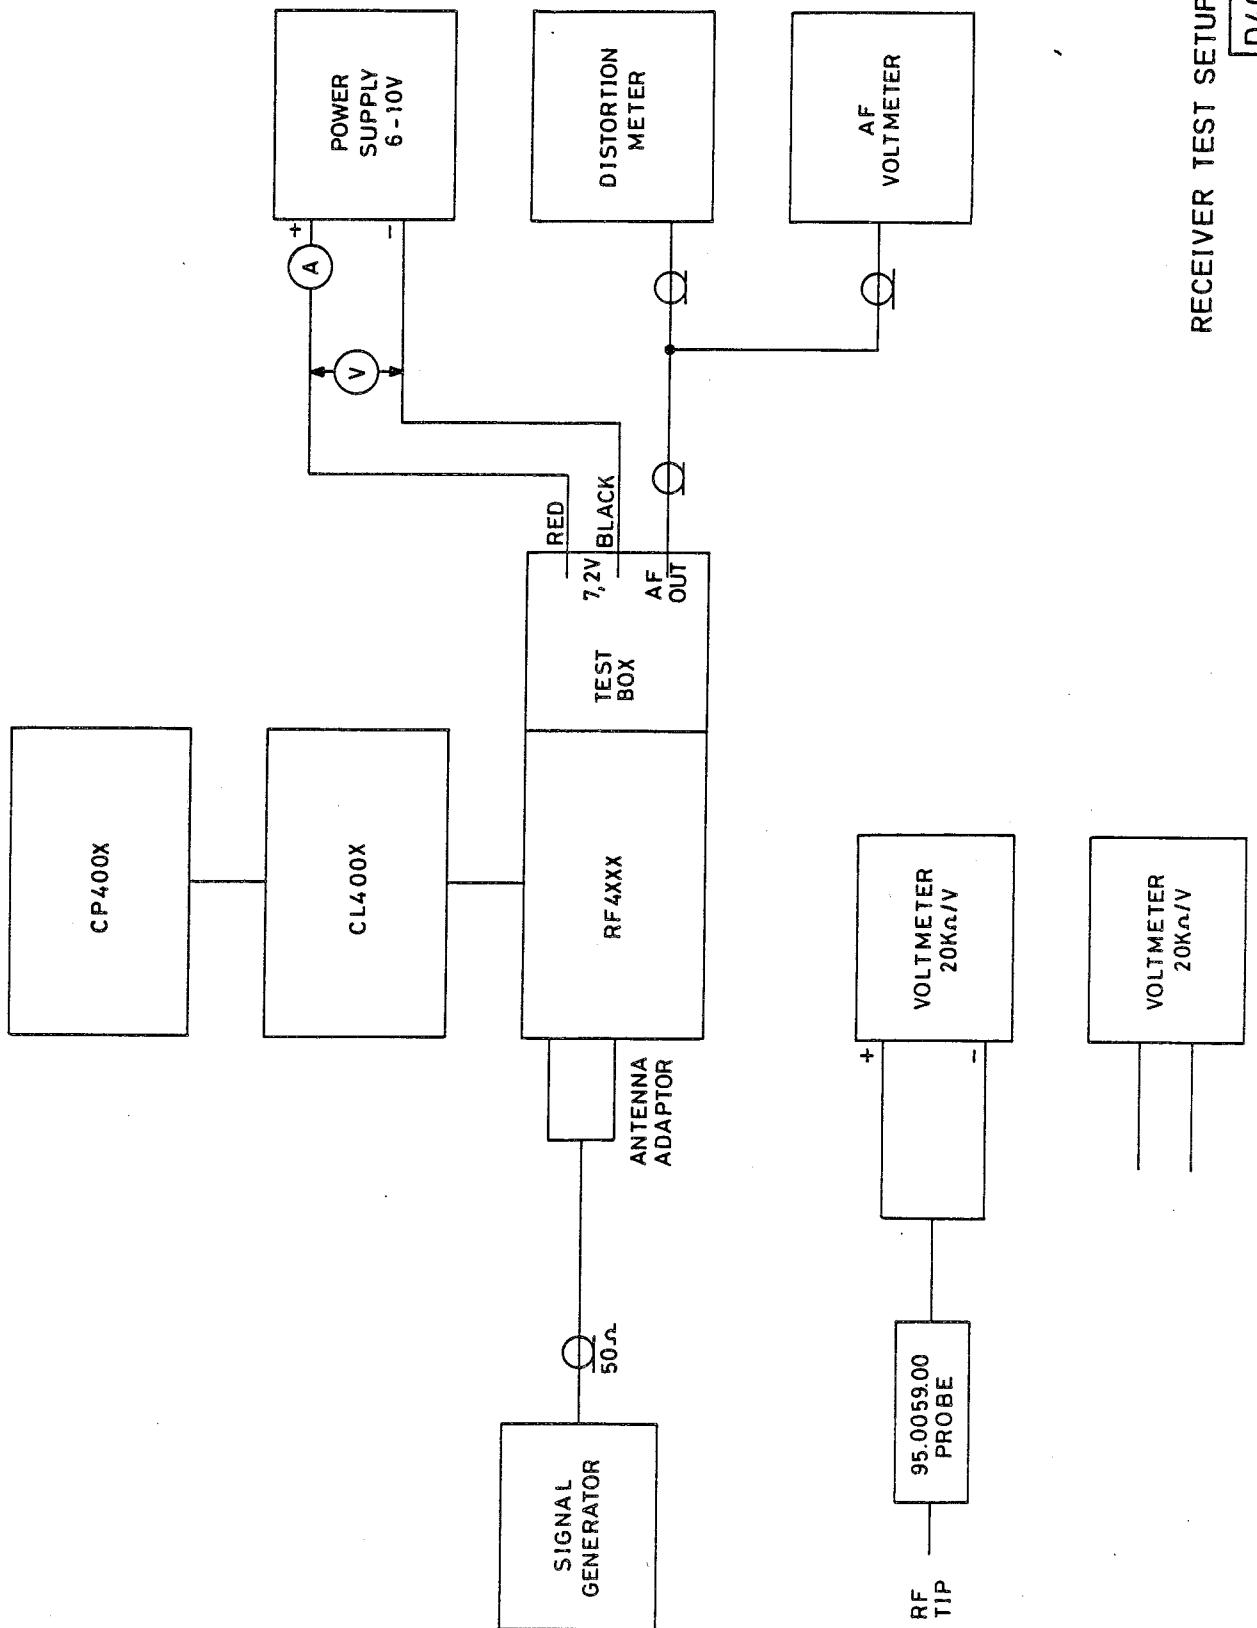

Set the LS-LINE switch on the test box to LINE.

Set the SQ switch to cancel.

Adjust the following coils for minimum distortion. L306, L305, L303, L302 and L508.

As the sensitivity increases during the adjustment decrease the signal generator output to maintain 12 dB SINAD.

Repeat the adjustments until no further improvement is possible.

Check the 12 dB SINAD on all channels.

Requirement: 12 dB SINAD for less than 0.45 uV.

6. SQUELCH ADJUSTMENT

Turn the squelch potentiometer R420 completely anticlockwise to close the squelch.

Open squelch by setting SQ switch to cancel.

Set the signal generator output to the value giving 12 dB SINAD.

Close squelch by setting SQ switch to normal. Slowly turn R420 clockwise to the point where the squelch just opens.

Vary the signal generator output slowly up and down to obtain the opening and closing level of the squelch.

Squelch opening level: 12 dB SINAD

Squelch closing level: 6-10 dB SINAD

FREQUENCY ADJUSTMENT

The reference oscillator frequency controls both the transmitter and receiver frequencies and final adjustment must be done with the chassis box properly assembled.

Turn the radio off and remove the test box.

Assemble the radio but use the service cabinet to hold the chassis box.

Connect the test box and turn the radio on.

Connect a frequency counter to the signal sampler, refer to transmitter test setup.

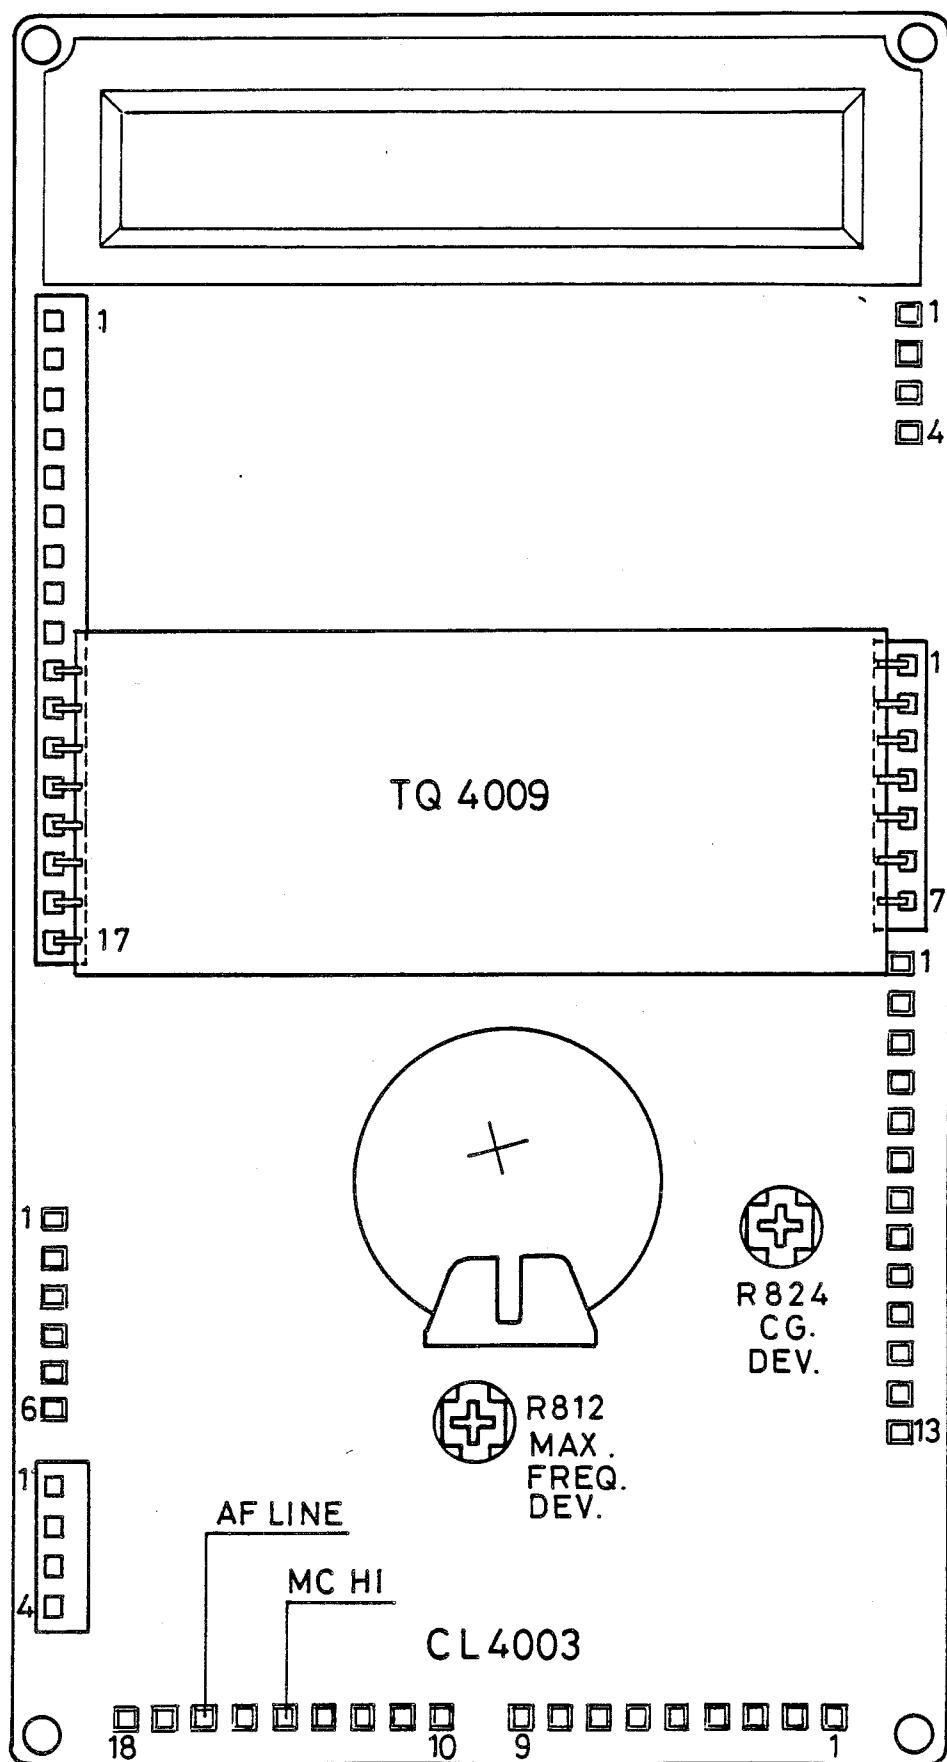

Key the transmitter.

Adjust, through the hole in the rear of the service cabinet, the reference oscillator, C533 for nominal frequency.

Requirement:

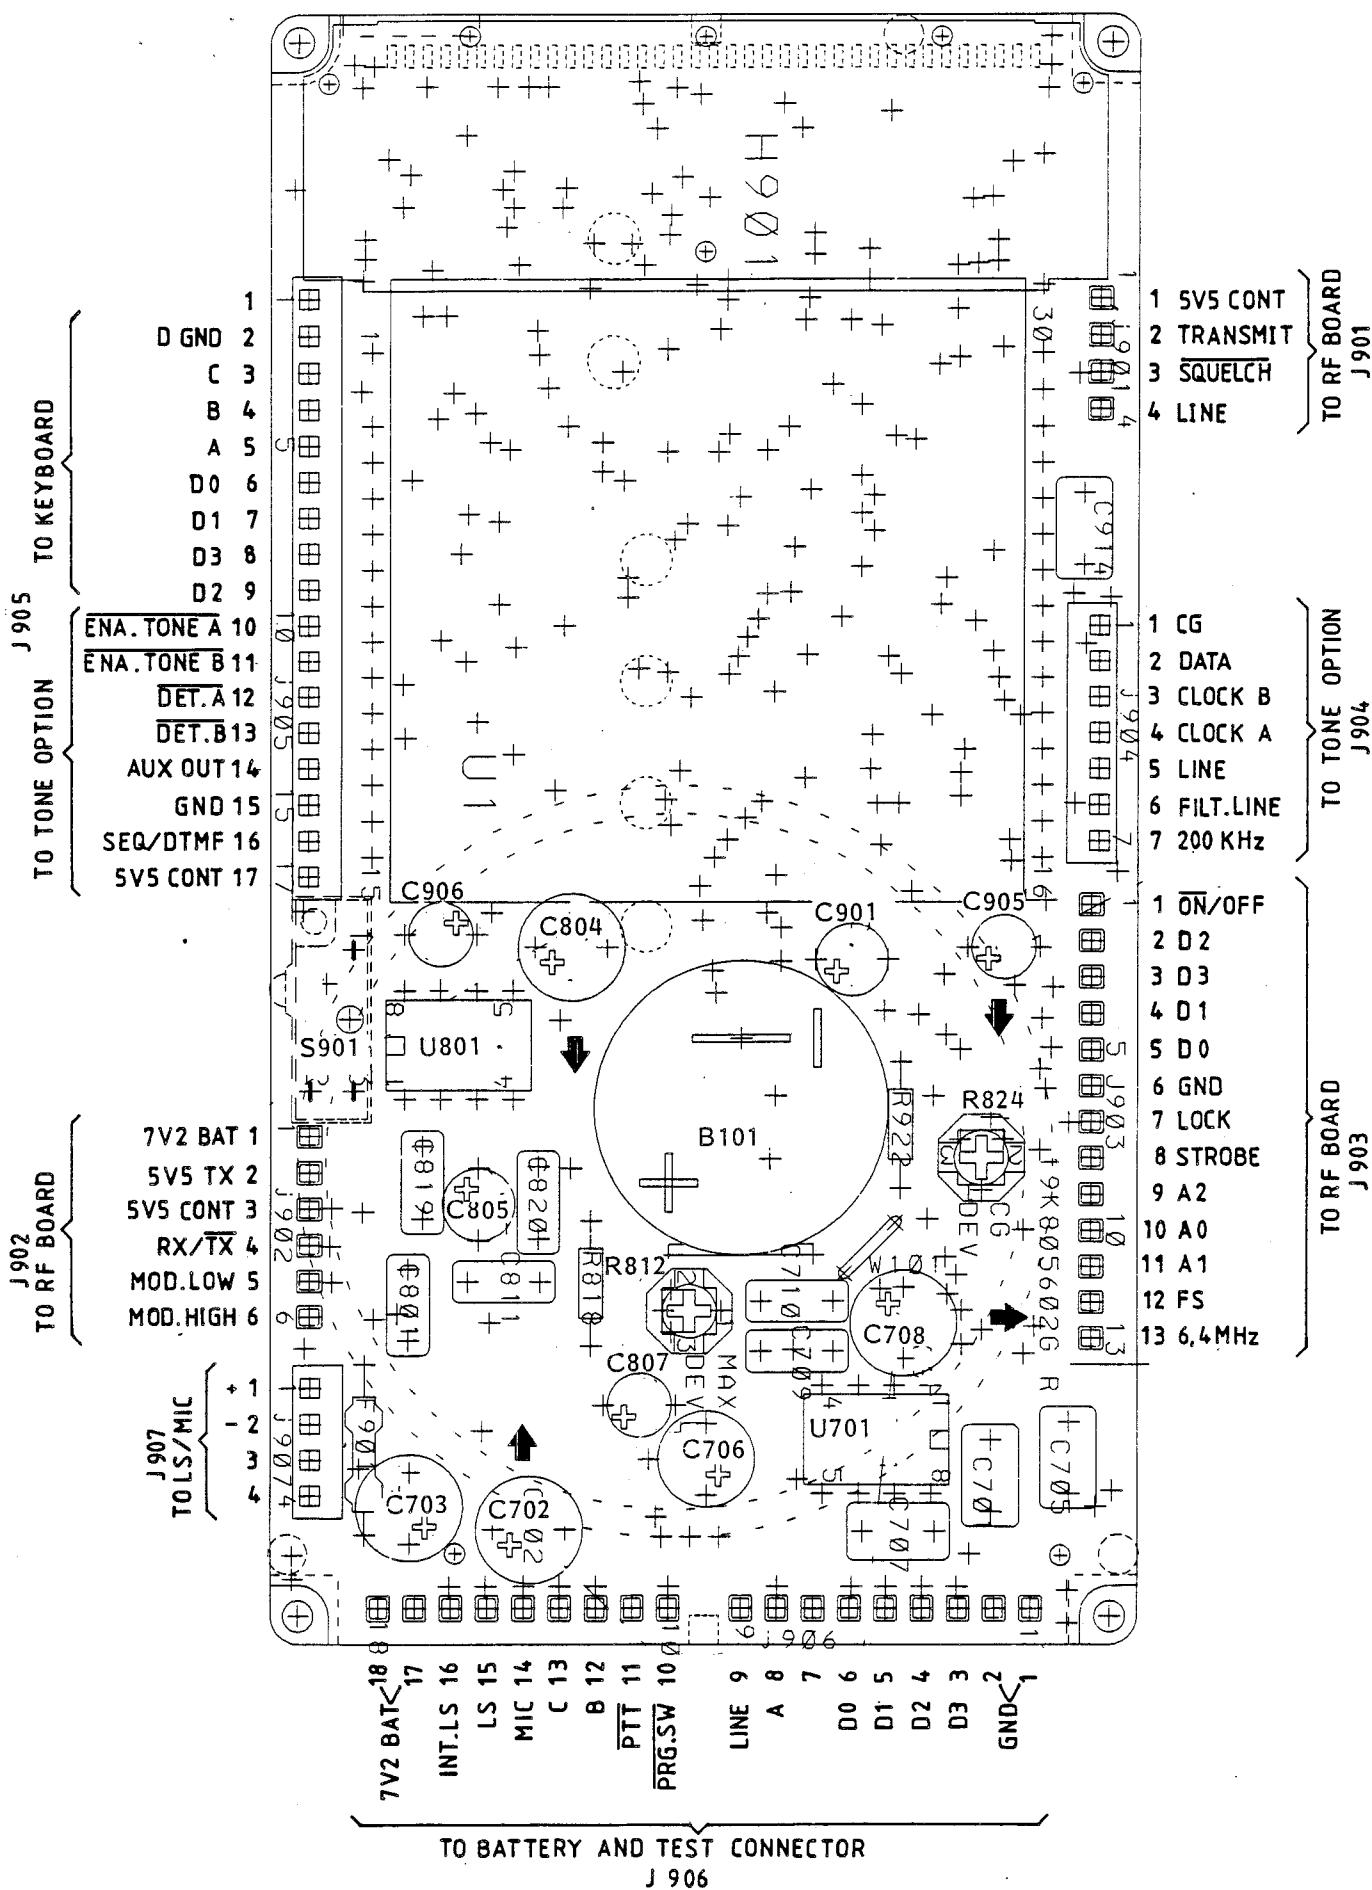

$$F = F_{\text{nom}} \pm 0.2 \text{ ppm} \text{ (30 Hz at 150 MHz).}$$

Switch to next channel. Verify the frequency for all channels. (Channel switching is not possible while transmitting).
