LINIESYSTEM LT1 OG LR1 BESKRIVELSE

GENEREKT.

Liniesystemet LT1 og LR1 bruges til fjernkontrol af radioenheder over en telefonlinie.

LR1 monteres sammen med radioenheden ved hjælp af et multikabel, og tilsluttes den private eller lejede telefonlinie.

I den anden ende af telefonlinien er LT1 tilsluttet.

LT1 styres ved hjælp af kontrol pulten HB1.

På denne måde kan mikrofon signal,tast og squelch funktioner overføres til radioenheden.

LT1 og LR1 kan kun anvendes på linier med jævnstrømsgennemgang.

LINIESENDER LT1.Tgn. Nr. EA3-820305

Liniesenderen består af 3 strømforsyninger, 2 LF-forstærkere, styringskredsløb og en linietransformator.

Den ene spændingsforsyning på 9 Volt stab,bruges til forsyning af mikrofonforstærker og forforstærker samt DC-styring af tast og SQ.

LF-effektforstærkeren forsynes med 12V DC og de 20V DC anvendes til liniespænding.

Når kontrolpulten tasteres, sendes via Q10 og Q14 en spænding ind på den inv. indgang på IC6, hvorved optokobleren IC8 aktiveres og frembringer en spænding på R74. Denne spænding føres igennem forstærkerne IC5 til strømgeneratoren Q11 og ud på telefonlinien over relæet A1 som er aktivt ved tast. Q12 fungerer som elektronisk sikring.

Ved en kortslutning af telefonlinien er max. strøm ca. 30 mA.

Samme funktion gennemløbes ved sq.reg. blot er relæ A1 ikke aktiveret, således at sq. strømmen løber modsat af tast strømmen.

Hele dette kredsløb er galvanisk adskilt fra de andre kredsløb ved hjælp af særskilt strømforsyning, optoisolator, relæ og linietransformator med gennemsłagsspændinger større end 2000 volt.

Ved tast føres mikrofonsignalet ind på Q1 og videre til begrænsningen IC1, gennem lavpasfilteret IC2 til emitterfølgeren Q3 som leder signalet til linietransformatoren.

Miktofonfølsomheden indstilles ved hjælp af R9. evt.tonesignal føres ind på R14.

Max. linieniveau indstilles ved hjælp af R24.

LF-signalet til højttaleren føres fra linietrafo til volumenkontrollen D11 og D10 og driver Q6 og videre til effektforstærkeren.

Transistorerne Q7 og Q8 fungerer som attenuatorer ved tast og andre blokeringsfunktioner. Transistorerne Q4 og Q5 indikerer ved hjælp af en lysdiode om linien er optaget.

LINIEMODTAGER LR1 Tgn.Nr.EA3-820504

LR1 modtager fra linien gennem optoisolatoren IC1 og Q1 spænding til tast af senderen.

Gennem optoisolatoren IC2 modtages spændingen til regulering af squelchniveuet. Tærskelværdien kan sættes med R6.

Hvis flere kontrolpulte er koblet parallel er det ikke muligt at have variabel squelch. Derfor forbindes strapningen "A". Herved aktiveres relæet A1 som indkobler potentiometeret R9 til indstilling af squelch.

Fra R5 tages LF-signalet til modulation af senderen.

LF-signalet fra radiomodtageren tages fra diskriminatoren pkt.8 og føres til forstærkeren IC3 som forstærker ca.10 gange. Signalet føres via R14 og Q3 til linietransformatoren.

Max. linieniveau indstilles ved hjælp af R14.

Forstærkeren squelchstyres ved hjælp af Q4,Q5 og Q6.

JUSTERING OG AFPRØVNING LT1 OG LR1.

LT1 PRINT TP133

STRØMGENERATOR: Et mA-meter forbindes over linieudgangen, pkt.18 og 19.
Anlægget tændes.

Indstil potentiometeret R74 således at mA-metret viser 3,5mA DC.
Derefter tastes kontrolboxen. Bemærk at strømmen vender og værdien er ca.
10 mA i modsat retning.
Hermed er strømgeneratoren indstillet.

MODULATIONSFORSTÆRKER: tilslut mikrofonindgangen et LF -signal på 20 mV
ved 1000Hz.

Potentiometer R24 og R9 sættes i midterstilling.
Linieudgangen belastes med 600 ohm og et AC - voltmeter tilsluttet.
Med potentiometer R 24 stilles niveauet ved tast til 0,7 Veff.
Derefter sænkes indgangsniveauet til 1,5mV og niveauet over linien stilles
nu til 0,42Veff. ved hjælp af potm.R9
Hermed er linieniveauet sat.

Derefter forbindes LT1 og LR1 sammen over linieudgang/indgang, og LR1
forbindes yderligere til en sende/modtager enhed.

Tilslut 12VDC.

LR1.PRINT TP134

SQUELCH: Når kontrolboxen lige er blevet tændt, trykkes én gang på SQ+ og
R6 justeres således at squelchen lige netop åbner.

Derefter forbindes strapningen "A" og potmeter R9 justeres så squelchen
netop er lukket.
Strapningen "A" fjernes.

LF - NIVEAU, LR1: Et AC - voltmeter tilsluttet linieudgangen.

Modtageren moduleres med 1000 Hz +-5KHz sving.
Herefter indstilles signalet på linieudgangen til 0,7 VACeff. ved hjælp
af R14.

MODULATIONS NIVEAU LR1: Når systemet er forbundet sammen skal modulations-
niveauet til radioenheden indstilles.

Mikrofonindgangen i LT1 påtrykkes et signal på 1,5 mV eff. ved 1000 Hz.

Et frekvenssvingsmeter er tilsluttet senderen, og med potmeter R5 i LR1
indstilles svinget til +-3 KHz.

Systemet er herefter færdigjusteret, og diverse funktioner efterprøves.

RP1 Tgn. Nr. EA3 - 820504

RP1 anvendes til styring af en repeaters funktioner.

Til at starte repeaterfunktionen kan anvendes flere former for tonesystemer samt squelchstyring.

Når der er bærebølge på repeateren vil Q7 trække og RC-leddet R27,C9 lades op.Hvis repeateren kaldes op,vil Q8 begynde at lede og dermed aktiverer gatesystemet NA2-NA3,som vil være selvholdende ved hjælp af af D8.

Senderen tastes gennem Q9 og Q10 som samtidig aktiverer relæ A2.

Transistor Q7 trækker Q12 on.Herved åbner switchen Q13.

LF-signalet føres gennem Q13 til relækontakten a2 og videre til senderens modulationsforstærker.

Repeater holde tiden er ca.15 sek.Indenfor denne tid kan repeateren anvendes uden opkald med forlængelse ved hver optastning.

Repeateren kan tvangsnedbrydes ved hjælp af tælleren IC5.

Hvis repeateren kaldes 4 gange hurtigt i rækkefølge,vil Q11 aktiveres og annullere holde tiden.

REMOTE CONTROL SYSTEM

DESCRIPTION.

GENERAL

The remote control system LT1 and LR1 is used to control a Transceiver via a 2 wire Telephoneline.

LR1 and the Transceiver are located in the one end, and the LT1 and the Control Box at the other end of the wire.

In this way it is possible to transfer microphonesignal, Key -and Squelch-functions to the transceiver Unit.

LT1 and LR1 may only be used in connection with DC-lines.

Linetransmitter LT1. DWG.No. EA3-820305

The linetransmitter consists of 3 powersupplies, a modulationamplifier, a poweramplifier, a controlcircuit and a linetransformer.

The one powersupply, 9V supplies the microphoneamplifier and the preamp. and the DC-control of the key and SQ.

The AF-poweramplifier is supplied with 12VDC, and the 20 VDC is used as linevoltage.

When the Controlbox is keyed, a voltage is placed via Q10 and Q14 at the inv.input of IC6, hereby activating the optoisolator, IC8, and producing a voltage on R74.

This voltage is led via the amplifiers IC5, to the current generator, Q11, and placed on the telephoneline via the relay A1.

Q12 act as a current limiter.

The current limit is appr. 30 mA at short circuited line.

The same function is achieved by SQ regulation, but in this situation the relay A1 is not active, thus the SQ current flows in the opposite direction of the key current.

The control circuit in its whole is galvanically separated from all other circuits. This is mainly achieved by its own powersupply, the optoisolater, the relay and linetransformer, which all withstand 2000VDC testvoltage.

The microphonesignal is placed at the base of Q1 and led to the limiter IC1 via the lowpassfilter IC2. The emitterfollower Q3 supplies the AF-signal to the linetransformer.

The sensitivity of the microphoneamplifier is adjustable by means of R9.

The tonesignal from the tonesystem, when used, is placed at R14.

Max. linelevel is adjustable by means of R24.

The AF-signal for the speaker is taken from the linetransformer and led to the volumecontrol, D11 and D10 and driver Q6 and passed to the poweramp. IC3. The transistors Q7 and Q8 are used as attenuators to block the AF-amp in the case of keying and for other blocking purposes.

The transistors Q4 and Q5 act as a modulation indicator.

The circuit indicates by means of a LED in the controlbox, if the line is busy.

Linereceiver LR1 DWG.No. EA3-820504

In the case of keying, LR1 receives a voltage from the linetransformer.

This voltage is led via IC1 and Q1 to the transmitter key relay.

The voltage for the regulation of the squelchlevel is obtained through the optoisolator IC2.

The threshold voltage is set by R6.

If more control boxes are connected in parallel, it is not possible to have adjustable squelch. Thus the points "A" are shorted, hereby activating the relay A1, which in turn switches the potentiometer R9 into the circuit for setting of the squelch level.

The AF-signal for the modulation of the transmitter is taken from R5.

The AF-signal from the receiver discriminator, is led to the amplifier IC3, which has appr. 10 times amplification.

This signal is supplied to the linetransformer via R14 and Q3.

Max. linelevel is adjustable by means of R14.

The amplifier IC3 is squelchcontrolled by means of Q4,Q5 and Q6.

Repeaterlogic RP1, DWG No. EA3-820504

RP1 controls the functions of a repeater.

The repeater start may be controlled by either the squelch or any kind of tonesystem.

When a carrier is present,Q7 will go "on" and R27,C9 is charged.

If now the repeater receives a start information Q8 will turn on,thus activating the gatesystem NA-2,NA-3,which takes a locked position by means of D8.

The transmitter is keyed via Q9 and Q10, and relay A2 is activated.

Transistors Q7 and Q12 operates the switch Q13.

The AF-signal is led via Q13 to the relay contact a2 and passed on to the modulationamplifier.

The repeater hold time is appr.15 sec. Within this time the repeater may be used without start information, and the hold time is renewed at every key-stroke.

In cases of disturbance or malfunctioning, the repeater may be forced to close down. This is accomplished by calling the repeater 4 times in a sequence, thus activating Q11 and hereby cancel the hold time.

ALIGNMENT PROCEDURE

LT1 and LR1

LT1. Print board TP133

Current generator: A DC mA-meter is connected across the line terminals 18 and 19.

The set is switched "ON".

Adjust potentiometer R74 until the meter reads 3,5 mA DC.

Then the controlbox is keyed.

Note that the current now flows in the opposite direction, and that the meter reads appr. 10 mADC.

Modulation amplifier

An Audio signal of 20mV at 1000 Hz is connected to the microphone input. R24 and R9 are set to mid position.

A 600 ohm resistor is connected across the line.

Connect an AC-Voltmeter across the 600 ohm resistor. Press the key button.

With potmeter R24 the max. linelevel is set to 0,7Veoff.

Adjust the input level to 1,5 mV and set the linelevel to 0,42Veoff by means of R9.

Then LT1 and LR1 are connected through the line, and the transceiver to LR1.

Supply 12V DC.

LR1 Print board TP134

Squelch:

Switch the controlbox "ON". Press the button SQ+ once, and turn R6 until the squelch just opens.

Short the points "A" and turn R9 until the squelch has just closed.

Remove the short from "A".

AF-level, LR1 An AC-voltmeter is connected across the lineterminals. The receiver is modulated with 1000 Hz \pm 5 KHz deviation.

Turn R17 until the max. linelevel of 0,7VACeff. is obtained.

Modulation level LR1

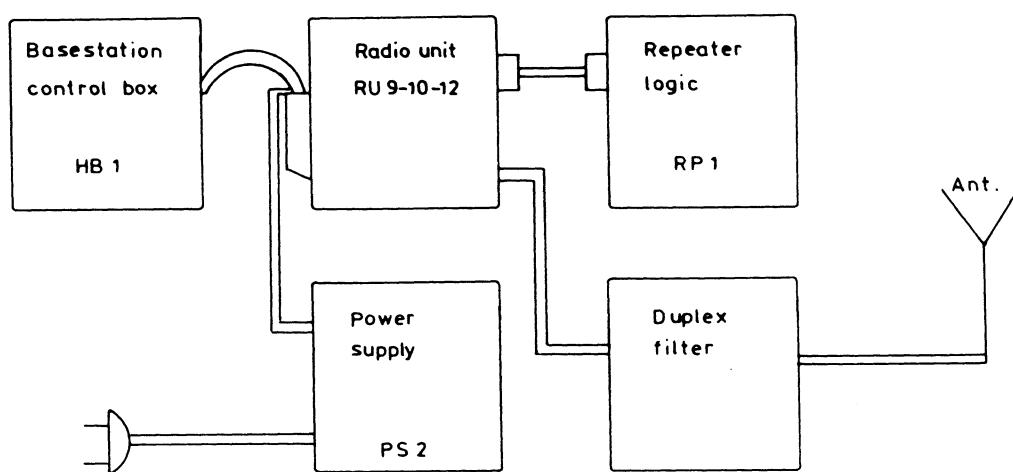

LT1 and LR1 are connected via the Line.

A signal of 1,5mVeoff at 1000 Hz is placed on the microphone input in LT1.

Connect a modulationmeter to the transmitter.

Key the transmitter and adjust the deviation to \pm 3KHz by means of R5 in the LR1.

The system is now fully aligned and all functions are checked.
